Preface to the sixth edition

The *BSAVA Small Animal Formulary* enters its sixth edition with a new Editor-in-Chief and a new look. In the three years since the last edition there has been a considerable change in the classification of medicines. The details of this are presented in the Introduction and the new classification is used throughout. However, many of the drugs listed in the Formulary still remain unauthorized for the species we treat. Authorized products should always be considered first for every patient. If unauthorized drugs are to be used ahead of an authorized product there must be a clear and definable clinical advantage to their use. Frequently one unauthorized medication is preferred to another.

Another new development is the inclusion in the monographs of information on specific handling requirements or human safety issues. Comments on the general handling of all drugs, including best dispensing practice, have been included in the Introduction. I urge all veterinary surgeons to read and follow this advice. The profession’s continuing legal authority to dispense medications depends on a demonstrably responsible attitude to pharmacy practice.

The *BSAVA Small Animal Formulary* should never be the only source of information that is consulted by veterinary surgeons and nurses who are confronted with a medication that they have not used before. The format of the Formulary does not allow a detailed discussion of the use of a particular drug. Relevant textbooks, such as the excellent series of Manuals published by the BSAVA, should be consulted as well. The Formulary is designed as an *aide mémoire* for drugs with which readers are already partly familiar. A list of further reading is provided in this Formulary.

Many of the drug uses, doses and adverse reactions that are recorded in this Formulary are taken from textbooks, which in turn have taken their information from a detailed analysis of the peer-reviewed literature. However, some information is less clear or less authoritative, particularly when considering the use of drugs in exotic species. Some information is derived from unreferenced sources, congress abstracts and even anecdotal personal communications. Ideally all drug uses, doses and adverse reactions would be obtained from well referenced sources with independent corroboration. This nirvana will not be achieved for many years, if ever. Therefore, the authors of the Formulary are now providing references for many of the drugs. This information, which will gradually be provided on the web-based version of the Formulary but not in the paper copy, will allow users to assess the level of evidence for a particular recommendation and act accordingly.
I am grateful for all the comments that have been made in the process of preparing this sixth edition and any comments on this new edition are welcome. Please post or email comments to me at Formulary@bsava.com. I wish to express my gratitude to all the Editorial Panel members for their work on this edition. I also thank the publishing team of Nicola, Ben and Marion at BSAVA for their editorial and administrative assistance. Lastly, I would like to acknowledge the huge debt of thanks that I, and all other BSAVA members, owe to my predecessor Dr Bryn Tennant for his unstinting efforts over the first five editions of this book. I hope the sixth edition maintains the high standards that he set and we can build on his achievements in the coming editions.

Ian Ramsey
February 2008
Foreword

The *BSAVA Small Animal Formulary* has become established as one of the most useful books on the practice shelf. It contains a wealth of vital information on available drugs and how to use them to best effect – but remains a manageable size and exceptionally user-friendly. As such, it is one of the most valued of the benefits of BSAVA membership; each BSAVA member is sent a free copy of each new edition as it is published.

The first edition of the formulary was published in 1994, and subsequent editions have been published at 3-yearly intervals since then. Ian Ramsey has taken over the role of Editor-in-Chief for this 6th edition from Bryn Tennant. Bryn is a hard act to follow; his hard work and expertise over the years has allowed each edition of the Formulary to surpass the preceding one, and the BSAVA is indebted to him for his long-term commitment to the project. However, Ian is a worthy successor who has tackled the task of updating the information contained within the Formulary with enthusiasm, energy and undoubted knowledge.

The appropriate and responsible use of medicines is a vital issue for the profession, both in the context of ensuring the best possible treatment for each individual patient, and in the wider context of human and animal health. The *BSAVA Small Animal Formulary* contributes in no small part by ensuring that veterinary surgeons remain well informed about drugs and their usage.

*Frances Barr* MA VetMB DVR PhD DipECVDI MRCVS
BSAVA President 2007–8
Introduction

How to use the Formulary
For information on a drug, look up the generic name in the A–Z section, where you will find each drug listed in a standard format.

Notes on the monographs

- **Name.** The rINN generic name is used. The list of trade names is not necessarily comprehensive, and the mention or exclusion of any particular commercial product is not a recommendation or otherwise as to its value. Any omission of a product that is authorized for a particular small animal indication is purely accidental. All monographs were updated in the period July–December 2007. Products that are not authorized for veterinary use are marked with an asterisk. Note that an indication that a product is authorized does not necessarily mean that it is authorized for all species listed in the monograph; users should check individual data sheets.

- **Action and Use.** Veterinary surgeons using this publication are warned that **many of the drugs and doses listed are not currently authorized** by the Veterinary Medicines Directorate (VMD) or the European Agency for the Evaluation of Medicinal Products (EMEA) (either at all or for a particular species), or manufacturers’ recommendations may be limited to particular indications. **The decision, and therefore the responsibility, for prescribing any drug for an animal lies solely with the veterinary surgeon.** Expert assistance should be obtained when necessary. The ‘cascade’ and its implications are discussed below.

- **Safety and handling.** This section only outlines specific risks and precautions for a particular drug that are different to the general advice given below in the ‘Health and safety in prescribing’ section.
Introduction

- **Contraindications and Adverse reactions:** Cautionary notes are included in the section on contraindications. Cautionary notes usually imply that increased monitoring and decreased doses should be used. The list of adverse reactions is not intended to be comprehensive and is limited to those effects that may be of clinical significance. The information for both of these sections is taken from published veterinary and human references and not just from product literature.

- **Drug interactions.** A listing of those interactions which may be of clinical significance.

- **Doses.** These are based on those recommended by the manufacturers in their data sheets and package inserts, or are based on those given in published articles or textbooks, or are based on clinical experience. These recommendations should be used only as guidelines and should not be considered appropriate for every case. Clinical judgement must take precedence. Where possible, doses have been given for individual species; however, sometimes generalizations are used. ‘Birds’ includes psittacines, raptors, pigeons and others. ‘Reptiles’ includes chelonians, lizards and snakes. ‘Small mammals’ includes ferrets, lagomorphs and rodents.

**Distribution categories**

Authorized small animal medicines now fall within the first four categories below and all packaging supplied by drug manufacturers and distributors has to be changed by 1st November 2008. Medical products not authorized for veterinary use retain their former classification (e.g. P, POM).

**AVM-GSL:** Authorized veterinary medicine – general sales list (formerly GSL). This may be sold by anyone.

**NFA-VPS:** Non-food animal medicine – veterinarian, pharmacist, Suitably Qualified Person (SQP) (formerly PML companion animal products and a few P products). These medicines for companion animals must be supplied by a veterinary surgeon, pharmacist or SQP. An SQP has to be registered with the Animal Medicines Training Regulatory Authority (AMTRA). Veterinary nurses can become SQPs but it is not automatic.

**POM-VPS:** Prescription-only medicine – veterinarian, pharmacist, SQP (formerly PML livestock products, MFSX products and a few P products). These medicines for food-producing animals (including horses) can only be supplied on an oral or written veterinary prescription from a veterinary surgeon, pharmacist or SQP and can only be supplied by one of those groups of people in accordance with the prescription.

**POM-V:** Prescription-only medicine – veterinarian (formerly POM products and a few P products). These medicines can only be supplied against a veterinary prescription that has been prepared (either orally or in writing) by a veterinary surgeon to animals under
their care following a clinical assessment, and can only be supplied by a veterinary surgeon or pharmacist in accordance with the prescription.

**ZFA:** This non-official term is used to indicate a zootechnical feed additive. These are authorized under EC Regulation 1831/2003: the manufacturing, distributing, incorporating, labelling, supply and use come within the scope of the Veterinary Medicines Regulations.

**SAES:** This non-official term is used to indicate medicines marketed in accordance with the Small Animal Exemption Scheme. These are medicines for use in certain pet species (aquarium fish, cage birds, ferrets, homing pigeons, rabbits, small rodents and terrarium animals) the active ingredient of which has been declared by the Secretary of State as not requiring veterinary control. These medicines are exempt from the requirement for a marketing authorization and are not therefore required to prove safety, quality or efficacy, but must be manufactured to the same standards as authorized medicines and are subject to pharmacovigilance reporting.

**CD:** Controlled Drug. A substance controlled by the Misuse of Drugs Act 1971 and Regulations. The CD is followed by (Schedule 1), (Schedule 2), (Schedule 3), (Schedule 4) or (Schedule 5) depending on the Schedule to The Misuse of Drugs Regulations 2001 (as amended) in which the preparation is included. You could be prosecuted for failure to comply with this act. **Prescribers are reminded that there are additional requirements relating to the prescribing of Controlled Drugs. For more information see the BVA Good Practice Guide on Veterinary Medicines or the Home Office website at www.drugs.gov.uk.**

**Schedule 1:** Includes LSD, cannabis, lysergide and other drugs that are not used medicinally. Possession and supply are prohibited except in accordance with Home Office Authority.

**Schedule 2:** Includes etorphine, morphine, papaveretum, pethidine, diamorphine (heroin), cocaine and amphetamine. Record all purchases and each individual supply (within 24 hours). Registers must be kept for 2 calendar years after the last entry. Drugs must be kept under safe custody (locked secure cabinet), except secobarbital. Drugs may not be destroyed except in the presence of a person authorized by the Secretary of State.

**Schedule 3:** Includes buprenorphine, pentazocine, the barbiturates (e.g. pentobarbital and phenobarbital but not secobarbital – now Schedule 2) and others. Buprenorphine, diethylpropion and temazepam must be kept under safe custody (locked secure cabinet); it is advisable that all Schedule 3 drugs are locked away. Retention of invoices for 2 years is necessary.

**Schedule 4:** Includes most of the benzodiazepines (temazepam is now in Schedule 3), and androgenic and anabolic steroids (e.g. clenbuterol). Exempted from control when used in normal veterinary practice.
Schedule 5: Includes preparations (such as several codeine products) which, because of their strength, are exempt from virtually all Controlled Drug requirements other than the retention of invoices for 2 years.

**The cascade**

Veterinary medicinal products must be administered in accordance with the prescribing cascade, as set out in the Medicines (Restrictions on the Administration of Veterinary Medicinal Products) Regulations 1994 as amended. These Regulations provide that when no authorized veterinary medicinal product exists for a condition in a particular species, and in order to avoid unacceptable suffering, veterinary surgeons exercising their clinical judgement may prescribe for one or a small number of animals under their care other suitable medications in accordance with the following sequence:

1. A veterinary medicine authorized for use in another species, or for a different use in the same species (‘off-label’ use).
2. A medicine authorized in the UK for human use.
3. A medicine to be made up at the time on a one-off basis by a veterinary surgeon or a properly authorized person.

‘Off-label’ use of medicines

‘Off-label’ use is the use of medicines outside the terms of their marketing authorization. It may include medicines authorized outside the UK that are used in accordance with an import certificate issued by the VMD. A veterinary surgeon with detailed knowledge of the medical history and clinical status of a patient, may reasonably prescribe a medicine ‘off-label’ in accordance with the prescribing cascade. Authorized medicines have been scientifically assessed against statutory criteria of safety, quality and efficacy when used in accordance with the authorized recommendations on the product literature. Use of an unauthorized medicine provides none of these safeguards and may, therefore, pose potential risks that the authorization process seeks to minimize.

Medicines may be used ‘off-label’ for a variety of reasons including:

- No authorized product is suitable for the condition or specific subpopulation being treated
- Need to alter the duration of therapy, dosage, route of administration etc., to treat the specific condition presented
- An authorized product has proved ineffective in the circumstances of a particular case (all cases of suspected lack of efficacy of authorized veterinary medicines should be reported to the VMD).

**Responsibility for the use of a medicine ‘off-label’ lies solely with the prescribing veterinary surgeon.** He or she should inform the owner of the reason why a medicine is to be used ‘off-label’ and record this reason in the patient’s clinical notes. When electing to use a medicine ‘off-label’ always:
• Discuss all therapeutic options with the owner
• Use the cascade to determine your choice of medicine
• Obtain signed informed consent if an unauthorized product is to
  be used, ensuring that all potential problems are explained to
  the client
• Administer unauthorized medicines against a patient-specific
  prescription. Do not administer to a group of animals if at all
  possible.

An ‘off-label’ medicine must show a comparative clinical advantage to
the authorized product in the specific circumstances presented
(where applicable). Medicines may be used ‘off-label’ in the following
ways (this is not an exhaustive list):

• Authorized product at an unauthorized dose
• Authorized product for an unauthorized indication
• Authorized product used outwith the authorized age range
• Authorized product administered by an unauthorized route
• Authorized product used to treat an animal in an unauthorized
  physiological state, e.g. pregnancy (i.e. an unauthorized indication)
• Product authorized for use in humans or a different animal
  species to that being treated.

Adverse effects may or may not be specific for a species, and
idiosyncratic reactions are always a possibility. If no adverse effects
are listed, consider data from different species. When using novel or
unfamiliar drugs, consider pharmaceutical and pharmacological
interactions. In some species, and with some diseases, the ability to
metabolize/excrete a drug may be impaired/enhanced. Use the
lowest dose that might be effective and the safest route of
administration. Ensure that you are aware of the clinical signs that
may suggest toxicity.

Information on ‘off-label’ use may be available from a wide variety of
sources (see Appendix).

**Drug storage and dispensing**

A code of practice on the storage and dispensing of medicines is
available (*BVA Good Practice Guide on Veterinary Medicines*). It is
recommended that, in general, medications are kept in and dispensed
in the manufacturer’s original packaging. Medicines can be adversely
affected by adverse temperatures, excessive light, humidity and rough
handling. Loose tablets or capsules that are repackaged from bulk
containers should be dispensed in child-resistant containers and
supplied with a package insert (if one exists). Tablets and capsules in
foil strips should be sold in their original packaging or in a similar
cardboard box for smaller quantities. Preparations for external
application should be dispensed in coloured fluted bottles. Oral liquids
should be dispensed in plain glass bottles with child-resistant closures.
All medicines should be labelled. The label should include:

- The owner’s name and address
- Date
- Product name (and strength)
- Total quantity of the product supplied in the container
- Instructions for dosage
- Practice name and address
- The wording ‘Keep out of reach of children’ and ‘For animal treatment only’

The words ‘For external use only’ should be included on labels for products for topical use. All labels should be typed.

In order to comply with the new Veterinary Medicines Regulations (2005), records of all products supplied on prescription must be kept for 5 years. When a batch is brought into use in a practice, the batch number and date should be recorded. It is not necessary to record the batch number of each medication used for a given animal.

Health and safety in dispensing

All drugs are potentially poisonous to humans as well as animals. Toxicity may be mild or severe and includes carcinogenic and teratogenic effects. Warnings are given in the monographs. However, risks to humans dispensing medicines are not always well characterized and idiosyncratic reactions may occur. **It is good practice for everyone to wear protective clothing (including gloves) when directly handling medicines, not to eat or drink (or store food or drink) near medicines, and to wash their hands frequently when working with medicines.** Gloves, masks and safety glasses should be worn if handling potentially toxic liquids, powders or broken tablets. Avoid breaking tablets of antineoplastic cytotoxic drugs and use laminar flow cabinets for the preparation and dispensing of these medications.

Many prescribers and users of medicines are not aware of the carcinogenic potential of the drugs they are handling. Below are lists of medicines included in the *BSAVA Formulary* that are known or potential carcinogens or teratogens. The lists are not all-inclusive: they include only those substances that have been evaluated. Most of the drugs are connected only with certain kinds of cancer. The relative carcinogenicity of the agents varies considerably and some do not cause cancer at all times or under all circumstances. Some may only be carcinogenic or teratogenic if a person is exposed in a certain way (for example, ingesting as opposed to touching the drug). For more detailed information refer to the International Agency for Research on Cancer (IARC) or the National Toxicology Program (NTP) (information is available on their respective websites).
Examples of drugs known or suspected to be human carcinogens (c) or teratogens (t):

- ACE inhibitors (t), e.g. benazepril, enalapril, ramipril
- Androgenic (anabolic) steroids (t, c)
- Antibiotics (c), e.g. metronidazole, chloramphenicol
- Antibiotics (t) e.g. aminoglycosides, doxycycline, trimethoprim, sulphamides
- Antifungals (c), e.g. ketoconazole, fluconazole, itraconazole, flucytosine
- Antineoplastic drugs (c, t) - all
- Antithyroid drugs (t), e.g. carbimazole/methimazole
- Beta-blockers (t)
- Dantron (c)
- Desferrioxamine (t)
- Diltiazem (t)
- Finasteride (t)
- Immunosuppressives (c), e.g. azathioprine, ciclosporin
- Lithium (t)
- Methotrexate (t)
- Misoprostol (t)
- NSAIDs (t)
- Penicillamine (t)
- Phenoxybenzamine (c)
- Phenytoin (c)
- Phenytoin (t)
- Progesterone (c) and some oestrogens (c)
- Vitamin A (t)
- Warfarin (t)

Note that most carcinogens are also likely to be teratogens.
Acarbose (Glucobay*) POM

Formulations: Oral: 50 mg, 100 mg tablets.

Action: Inhibits brush border enzymes in the small intestine that are involved in carbohydrate digestion, thereby delaying the postprandial glucose peak.

Use: Management of the glycaemic control of diabetic animals that are responding poorly to insulin and dietary management, by a subtle lowering of blood glucose.

Safety and handling: Normal precautions should be observed.

Contraindications: Contraindicated in humans during pregnancy or with any concurrent inflammatory bowel disease.

Adverse reactions: Diarrhoea and flatulence are common (particularly at high doses), weight loss may occur and abnormal liver function tests, hepatitis and jaundice have been reported in humans.

Drug interactions: Synergistic effect with sulphonylureas.

DOSES

Dogs: 12.5-25 mg/dog p.o. q12h (increase to 50 mg/dog q12h if no effect after 2 weeks and can titrate dose to 100 mg/dog although side effects will occur).

Cats: 12.5-25 mg/cat p.o. q12h.

Small mammals, Birds, Reptiles: No information available.

Acepromazine (ACP) (ACP) POM-V

Formulations: Injectable: 2 mg/ml solution. Oral: 10 mg, 25 mg tablets.

Action: Phenothiazine with depressant effect on the CNS, thereby causing sedation and a reduction in spontaneous activity.

Use: Sedation or pre-anaesthetic medication in dogs and cats. Sedation is unreliable when ACP is used alone; combining ACP with an opioid drug improves sedation (neuroleptanalgesia) and the opioid provides analgesia. The depth of sedation is dose-dependent up to a plateau (0.1 mg/kg); further increases in dose prolong the duration of sedation. Onset of sedation is 20-30 min after i.m. administration; clinical doses cause sedation for up to 6 hours. The oral dose of ACP tablets required to produce sedation varies between individual animals and high doses can lead to very prolonged sedation (see Sedation protocols in Appendix). Also used for the management of thromboembolism in cats because of its peripheral vasodilatory action. The use of ACP in the management of sound phobias in dogs, such as firework or thunder phobia, is not recommended by behaviourists.

Safety and handling: Normal precautions should be observed.

Contraindications: Hypotension due to shock, trauma or cardiovascular disease. Avoid in animals <3 months and animals with liver disease. Large breeds of dog are very sensitive to ACP when
dosed on a mg/kg basis; use the lowest end of the dose range in these breeds. In Boxers spontaneous fainting and syncope can occur due to sinoatrial block caused by excessive vagal tone; use low doses (0.01 mg/kg i.m.) or avoid ACP in this breed.

**Adverse reactions:** Rarely, healthy animals may develop profound hypotension following administration of phenothiazines. Supportive therapy to maintain body temperature and fluid balance is indicated until the animal is fully recovered. Can lead to seizures in gerbils.

**Drug interactions:** Administration of ACP in combination with alpha-2 agonists is not advised due to the excessive hypotension that may result. Other CNS depressant agents (e.g. barbiturates, propofol, volatile anaesthetics) will cause additive CNS depression if used with ACP. Doses of other anaesthetic drugs should be reduced when ACP has been used for premedication. Quinidine given with phenothiazines may cause additional cardiac depression. Increased levels of both drugs may result if propanolol is administered with phenothiazines. As phenothiazines block alpha-adrenergic receptors, concomitant use with adrenaline may lead to unopposed beta activity, thereby causing vasodilation and tachycardia. Antidiarrhoeal mixtures (e.g. kaolin/pectin, bismuth salicylate) and antacids may cause reduced GI absorption of oral phenothiazines.

**DOSES**

**Dogs, Cats:** 0.01-0.02 mg/kg slowly i.v.; 0.01-0.05 mg/kg i.m., s.c.; 1-3 mg/kg p.o.

**Small mammals:** Ferrets: 0.2-0.5 mg/kg i.m., s.c., p.o.; Rabbits: 0.1-1.0 mg/kg i.m., s.c.; Guinea pigs: 2.5-5 mg/kg i.m., s.c., p.o.; Hamsters: 5 mg/kg i.m., s.c., p.o.; Gerbils: 3 mg/kg i.m., s.c., p.o.; Mice: 1-5 mg/kg i.m., s.c., p.o.

**Birds:** Not recommended.

**Reptiles:** 0.1-0.5 mg/kg i.m.

---

**Acetaminophen** see **Paracetamol**

**Acetazolamide** (Diamox*, Diamox SR*) POM

**Formulations:** Injectable: 500 mg vial (powder for reconstitution). Oral: 250 mg tablets, capsules.

**Action:** Systemic carbonic anhydrase inhibitor that reduces intraocular pressure by reducing aqueous humour production by inhibiting bicarbonate ion formation within the ciliary body epithelium.

**Use:** Treatment of acute glaucoma. However, it is not considered as the treatment of choice for long-term control of glaucoma. Topical carbonic anhydrase inhibitors are preferred for chronic glaucoma in dogs and cats. The concurrent use of a topical or systemic carbonic
anhydrase inhibitor is not beneficial as there is no additional decrease in intraocular pressure compared with the sole use of either topical or systemic treatment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in anorexic dogs, those with hepatic or renal dysfunction and those with sulphonamide hypersensitivity. Cats are particularly susceptible to the adverse effects of systemic carbonic anhydrase inhibitors; avoid in this species.

**Adverse reactions:** Weakness, GI disturbances (anorexia, vomiting, diarrhoea), panting, metabolic acidosis, diuresis, electrolyte disturbances in particular potassium depletion.

**Drug interactions:** Primidone absorption may be inhibited by oral acetazolamide. Acetazolamide alkalizes urine; thus, excretion rate of weak bases may be decreased but weak acid excretion increased. Concomitant use of corticosteroids may exacerbate potassium depletion, causing hypokalaemia.

**DOSES**

**Dogs:** 5-10 mg/kg i.v. single dose, 4-8 mg/kg p.o. q8-12h.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

---

**Acetylcysteine** (Ilube*, Parvolex*) POM

**Formulations:** Injectable: 200 mg/ml solution. Topical: 5% ophthalmic solution in combination with 0.35% hypromellose ophthalmic drops in 10 ml bottle.

**Action:** Decreases the viscosity of bronchial secretions, maintains glutathione levels in the liver and has some anticollagenase activity.

**Use:** Reduces the extent of liver injury in cases of paracetamol (acetaminophen) poisoning and can also be used as a mucolytic in respiratory disease. Oral solution should be diluted to a 5% solution and given via a stomach tube as it tastes unpleasant. Acetylcysteine may be useful in the treatment of keratoconjunctivitis sicca (KCS) (dry eye), or in ‘melting’ corneal ulcers although there is limited in vivo work to confirm this. In the eye it may be used in conjunction with hypromellose. In rabbits direct application into the ear has been reported as beneficial in cases of secretory otitis media, reducing inflammation and preventing long-term fibrotic changes.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Acetylcysteine has caused hypersensitivity and bronchospasm when used in the pulmonary tree. When given orally for paracetamol poisoning it may cause GI effects (nausea, vomiting) and, rarely, urticaria.

**Drug interactions:** No information available.
DOSES

**Dogs, Cats:**
- Mucolytic: Either nebulize 50 mg as a 2% (dilute with saline) solution over 30-60 min or instil directly into the trachea 1-2 ml of a 20% solution.
- Paracetamol poisoning: After inducing emesis, use immediately if ingestion occurred within 24 hours. Either give 150 mg/kg by i.v. infusion in 200 ml 5% glucose over 15 min, followed by 50 mg/kg i.v. infusion in 500 ml over 4 hours, then 100 mg/kg i.v. infusion in 1000 ml over 16 hours or give 140 mg/kg loading dose p.o., then 70 mg/kg p.o. q4h for 17 doses unless initial serum paracetamol levels indicate a non-toxic level.
- KCS: 1 drop of the ophthalmic solution topically to the eye q6-8h. Rarely used now for this indication.
- Melting corneal ulcers: 1 drop of the ophthalmic solution q1-4h in the affected eye for 24-48 hours. Topical autologous serum is more effective for the treatment of a melting corneal ulcer and is preferred.

**Small mammals:** Rabbits: Mucolytic: either nebulize 50 mg as a 2% (dilute with saline) solution over 30-60 min or instil directly into the trachea; Otic lavage: 1-2 ml of a 20% solution.

**Birds:** Mucolytic: as Rabbits (2-5 drops in 15 ml saline for nebulization).

**Reptiles:** 2% solution (dilute with saline) nebulized for 15 min.

Acetylsalicyclic acid see Aspirin

**Aciclovir** (Zovirax*) POM

**Formulations:** Ophthalmic: 5% ointment in 2 g, 10 g tubes.

**Action:** Inhibits viral replication (viral DNA polymerase); depends on viral thymidine kinase for phosphorylation.

**Use:** Management of ocular feline herpesvirus (FHV-1) infections. *In vitro* studies suggest the combination of aciclovir and recombinant human interferon to be more effective against FHV-1 than aciclovir on its own; *in vivo* efficacy of the combination is not known. The clinical use of aciclovir on its own is questionable. Aciclovir is virostatic and is unable to eradicate latent viral infection. In refractory and severe cases of FHV-1 ulceration, combined therapy including topical antiviral medication, human recombinant IFN-alpha and oral lysine, can be used. Also used to treat herpesvirus infections of other species (e.g. Pacheco’s disease in psittacid birds).

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.
Adverse reactions: Ocular irritation may occur and the frequency of application should be reduced if this develops. Treatment should not be continued for >3 weeks.

Drug interactions: No information available.

DOSES

Dogs: Not applicable.

Cats: Apply a small amount to affected eye q4-6h for a maximum of 3 weeks.

Small mammals: No information available.

Birds: Psittacids: 80 mg/kg p.o., i.v., i.m. q8h or 240 mg/kg in food in avaries.

Reptiles: 80 mg/kg p.q. q8-24h; topically to oral lesions q8-24h.

There is a suggestion that q8h dosing is more successful than q24h dosing.

ACP see Acepromazine
ACTH see Tetracosactide
Actinomycin-D see Dactinomycin
Activated charcoal see Charcoal

Adrenaline (Epinephrine) (Adrenaline*, Epinephrine*) POM

Formulations: Injectable: Range of concentrations for injection (0.1-1 mg/ml); 1 mg/ml (1:1000) is commonly used in veterinary practice.

Action: Adrenaline exerts its effects via alpha-1, -2 and beta-1 and -2 adrenoreceptors.

Use: Cardiac resuscitation, status asthmaticus and to offset the effects of histamine release in severe anaphylactoid reactions. The ophthalmic preparation is used in open angle glaucoma. The effects of adrenaline vary according to dose. Infusions of low doses mainly result in beta-adrenergic effects (increases in cardiac output, myocardial oxygen consumption, and a reduced threshold for arrhythmias with peripheral vasodilation and a fall in diastolic blood pressure). At high doses alpha-1 effects predominate, causing a rise in systemic vascular resistance, diverting blood to the central organs; however, this may improve cardiac output and blood flow. Adrenaline is not a substitute for fluid replacement therapy. Respiratory effects include bronchodilation and an increase in pulmonary vascular resistance. Renal blood flow is moderately decreased. The duration of action of adrenaline is short (2-5 min).

Safety and handling: Do not confuse adrenaline vials of different concentrations. Adrenaline is sensitive to light and air: do not use if it is pink, brown or contains a precipitate. It is unstable in 5% dextrose.
Contraindications: Intracardiac injection is not recommended. Beware of using in animals with diabetes mellitus (monitor blood glucose concentration), hypertension or hyperthyroidism. Use with caution in hypovolaemic animals.

Adverse reactions: Increases myocardial oxygen demand and produces arrhythmias including ventricular fibrillation. These may be ameliorated by administering oxygen and slowing the heart rate with beta-2 antagonists. Other adverse effects include tachycardia, arrhythmias, dry mouth and cold extremities. Repeated injections can cause necrosis at the injection site.

Drug interactions: Toxicity may occur if used with other sympathomimetic amines because of additive effects. The effects of adrenaline may be potentiated by antihistamines and thyroxine. Propanolol may block the beta effects of adrenaline, thus facilitating an increase in blood pressure. Alpha blocking agents or diuretics may negate or diminish the pressor effects. When adrenaline is used with drugs that sensitize the myocardium (e.g. halothane, high doses of digoxin) monitor for signs of arrhythmias. Hypertension may result if adrenaline is used with oxytocic agents.

DOSES

Dogs: 20 µg/kg of a 1:1000 solution (1000 µg/ml) diluted to 5-10 ml in normal saline and given i.v. or intraosseously. Can be given intratracheally for resuscitation of intubated animals, but higher doses may be required. A long catheter should be used to ensure the drug is delivered into the bronchi beyond the end of the endotracheal tube. For dogs <10 kg use a 1:10,000 solution. Use lower doses for the management of bronchoconstriction. The i.v. route is preferred if hypotension accompanies an anaphylactoid reaction. Repeat doses may be required at intervals of 2-5 min.

Cats: 20 µg/kg of a 1:10,000 solution (100 µg/ml) i.v., intraosseous, intratracheal.

Small mammals: Rodents: 3 µg/kg i.v.

Birds: 0.1-1.0 mg/kg i.v., intraosseous, intracardiac, intratracheal.

Reptiles: 0.5 mg/kg i.v., intraosseous, 1 mg/kg intratracheally diluted in 1 ml/100 g body weight.

Aglepristone (Alizin) POM-V

Formulations: Injectable: 30 mg/ml solution.

Action: Progesterone receptor blockage leads to reduced progesterone support for pregnancy.

Use: Termination of pregnancy in bitches up to 45 days from mating. In bitches confirmed as pregnant, a partial abortion may occur in up to 5%; owners should be warned. A clinical examination (uterine palpation) is always recommended 10 days after treatment and at least 30 days after mating in order to confirm termination. In bitches treated beyond the 20th day of gestation, abortion may be
accompanied by the physiological signs of parturition, i.e. fetal expulsion, slight anorexia, mammary congestion. After induced abortion an early return to oestrus is frequently observed (the oestrus-to-oestrus interval may be shortened by 1-3 months).

**Safety and handling:** Use with care. Accidental injection may be a hazard to women who are pregnant or intending to become pregnant.

**Contraindications:** No information available.

**Adverse reactions:** Transient pain at the injection site; any local inflammation produced resolves uneventfully.

**Drug interactions:** No information available.

**DOSES**

*Dogs:* 10 mg/kg s.c. q24h for two doses.

*Cats:* Not used.

**Small mammals, Birds, Reptiles:** No information available.

---

**Alfaxalone** (Alfaxan CD) POM-V

**Formulations:** Injectable: 10 mg/ml solution; the alfaxalone is solubilized in a cyclodextrin.

**Action:** Anaesthesia induced by the CNS depressant effect of the alfaxalone.

**Use:** Induction agent used before inhalational anaesthesia, or as a sole anaesthetic agent for examination or surgical procedures. As with all i.v. anaesthetic drugs, premedication will reduce the dose required for induction and maintenance of anaesthesia. The drug should be given slowly and to effect in order to prevent inadvertent overdose. The dose recommended by the manufacturer for induction of anaesthesia can usually be reduced in all animals. Analgesia is insufficient for surgery: other analgesic drugs such as opioids should be incorporated into the anaesthetic protocol. Alfaxalone is shorter acting and causes less excitement during recovery than the alfaxalone/alfadalone combination previously available. The cyclodextrin carrier does not cause histamine release in dogs (cf. the cremaphor EL of the combination).

**Safety and handling:** Does not contain an antimicrobial preservative; thus it is recommended that the remainder of an opened bottle is discarded after single use.

**Contraindications:** Do not use in combination with other i.v. anaesthetic agents. Safety in animals <12 weeks old has not been demonstrated.

**Adverse reactions:** A slight increase in heart rate can occur immediately after i.v. injection as a compensatory response to maintain blood pressure in the face of mild hypotension. This effect can be minimized by slow i.v. injection. As with all anaesthetic drugs, respiratory depression can occur with overdoses. Longer recoveries from anaesthesia are likely to occur when alfaxalone is used for maintenance of anaesthesia.
Drug interactions: No information available.

DOSES

Dogs: 3 mg/kg i.v. in unpremedicated dogs; 2 mg/kg i.v. in premedicated dogs for induction of anaesthesia, although commonly lower doses can be used. 6-9 mg/kg/h is recommended as a continuous rate infusion for maintenance of anaesthesia or top-up boluses of 1-1.5 mg/kg every 10 min.

Cats: 2-5 mg/kg i.v. for induction of anaesthesia; the lower end of the dose range is often adequate. 7-10 mg/kg/h is recommended as a continuous rate infusion for maintenance of anaesthesia or top-up boluses of 1-1.5 mg/kg q10min.

Small mammals: Ferrets: 9-12 mg (0.5-0.75 ml)/kg i.v., i.m.; Rabbits: 6-9 mg/kg i.v. or 9 mg/kg i.m.; Guinea pigs: 40 mg/kg i.m. or i.p.; Other rodents: 20 mg/kg i.m. or 120 mg/kg i.p.

Birds: No information available.

Reptiles: 6-9 mg/kg i.v. or 15 mg/kg i.m.

Alfentanil (Rapifen*) POM CD Schedule 2

Formulations: Injectable: 0.5 mg/ml solution, available in 2 ml or 10 ml vials; 5 mg/ml solution.

Action: Pure OP3 agonist of the phenylpiperidine series.

Use: Very potent opioid analgesic (10-20 times more potent than morphine) used to provide intraoperative analgesia during anaesthesia in dogs and cats. Use of such potent opioids during anaesthesia contributes to a balanced anaesthesia technique but they must be administered accurately. It has a rapid onset (15-30 seconds) and short duration of action. It is best given using continuous rate infusions. The drug is not suited to provision of analgesia in the postoperative period.

Safety and handling: Normal precautions should be observed.

Contraindications: Animals with pre-existing respiratory compromise.

Adverse reactions: A reduction in heart rate is likely whenever alfentanil is given; atropine can be administered to counter bradycardia if necessary. Respiratory depression leading to cessation of spontaneous respiration is likely following administration. Do not use unless facilities for positive pressure ventilation are available (either manual or automatic). Rapid i.v. injection can cause a severe bradycardia, even asystole.

Drug interactions: Alfentanil reduces the dose requirements of concurrently administered anaesthetics, including inhaled anaesthetics, by at least 50%.

DOSES

Dogs: 0.001-0.005 mg/kg i.v. as a single bolus or 0.001-0.0025 mg/kg/min continuous rate infusion.
**Cats:** 0.001 mg/kg i.v. as a single bolus or 0.001 mg/kg/min continuous rate infusion. Clinical evaluation of alfentanil in cats is very limited.  
**Small mammals, Birds, Reptiles:** No information available.

**Allopurinol** (Zyloric*) POM  
**Formulations:** Oral: 100 mg, 300 mg tablets.  
**Action:** Xanthine oxidase inhibition decreases formation of uric acid by blocking the conversion of hypoxanthine to xanthine, and of xanthine to uric acid.  
**Use:** In dogs, the treatment and prevention of recurrent uric acid uroliths and hyperuricosuric calcium oxalate urolithiasis and, in combination with meglumine antimonate, to treat leishmaniasis. In birds and reptiles it is used in the treatment of hyperuricaemia and gout, and in the management of renal disease.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** Use with caution in patients with impaired renal function.  
**Adverse reactions:** In humans, allopurinol may enhance the effects of azathioprine and theophylline.  
**Drug interactions:** No information available.  
**DOSES**  
**Dogs:**  
- Uric acid urolithiasis: 10 mg/kg p.o. q8h for 1 month, then 10 mg/kg p.o. q24h.  
- Leishmaniasis: 30 mg/kg p.o. q24h with meglumine antimonate for up to 3 months, then 20 mg/kg p.o. q24h for one week each month.

**Cats, Small mammals:** No information available.  
**Birds:** 10 mg/kg p.o. q12h (all species); Pigeons: 830 mg/l drinking water; Psittacids: 10 mg/30 ml drinking water.  
**Reptiles:** 10-20 mg/kg p.o. q24h (most species); Chelonians: 50 mg/kg p.o. q24h for 30 days then q72h.

**Alphaxalone** see **Alfaxalone**

**Alprazolam** (Alprazolam*, Xanax*) POM  
**Formulations:** Oral: 0.25 mg, 0.5 mg tablets.  
**Action:** Increases GABA activity within the CNS, resulting in anxiolysis and a range of cognitive effects including the inhibition of memory.
**Use:** Treatment of anxiety and fear-related disorders in dogs and cats, especially where there are signs of panic. Best if used approximately 30 minutes before a fear-inducing event. Its short half-life and rapid onset of action make it useful for the management of acute episodes, with treatment given as needed within the dosing limits described. In addition, its amnesic properties mean it can be used during or immediately following an aversive experience to minimize the impact of such exposure. This may be necessary during a long-term behavioural therapy programme to avoid relapses due to exposure to an intensely fear-inducing stimulus during treatment. Higher range doses are required for amnesic activity. Alprazolam may be used as an adjunct to clomipramine for the management of phobic responses. It can also be used for the management of urine spraying in cats but a high relapse rate upon withdrawal should be expected.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Hypersensitivity to benzodiazepines, glaucoma, significant liver or kidney disease, though appears to be less hepatotoxic than diazepam or clorazepate. Not recommended in pregnant or lactating animals.

**Adverse reactions:** Drowsiness and mild transient incoordination may develop. A general concern with benzodiazepines concerns disinhibition and the subsequent emergence of aggression.

**Drug interactions:** Caution is advised if used in association with antifungals such as ketoconazole, which inhibit its metabolism.

**DOSES**

**Dogs:** 0.01-0.1 mg/kg p.o. q8h.

**Cats:** 0.125-0.25 mg/kg p.o. q12h.

**Small mammals, Birds, Reptiles:** No information available.

**Formulations:** Oral: Aluminium hydroxide is available as a dried gel. Other products are composite preparations containing a variety of other compounds including magnesium oxide, hydroxide or trisilicate, potassium bicarbonate, sodium carbonate and bicarbonate, alginates and dimeticone. Aluminium hydroxide content varies.

**Action:** Neutralizes gastric hydrochloric acid. May also bind bile acids and pepsin and stimulate local prostaglandin (PGE-1) production. Also binds inorganic phosphate (PO₄³⁻) in the GI tract, making it unavailable for absorption.

**Use:** Management of gastritis and gastric ulceration. In renal failure, to lower serum phosphate levels in cats and dogs with hyperphosphataemia. Frequent administration is necessary to prevent rebound acid secretion. Phosphate-binding agents are
usually only used if low-phosphate diets are unsuccessful. Monitor serum phosphate levels at 10-14 day intervals and adjust dosage accordingly if trying to normalize serum concentrations. Thoroughly mix the drug with food to disperse it throughout the GI tract and to increase its palatability.

**Safety and handling:** Long-term use (many years) of oral aluminium products in humans has been associated with aluminium toxicity and possible neurotoxicity. This is unlikely to be a problem in veterinary medicine.

**Contraindications:** No information available.

**Adverse reactions:** Constipation may occur. This is an effect of the aluminium compound and is counteracted by inclusion of a magnesium salt.

**Drug interactions:** Do not administer digoxin, tetracycline or fluoroquinolone products orally within 2 hours of aluminium salts as their absorption may be impaired.

**DOSES**

**Dogs, Cats:** Initially 10-30 mg/kg p.o. q6-8h (tablets) or 0.5-1.0 ml/kg (2-30 ml) p.o. q6-8h (gel) with or immediately after meals. Dosages are empirical; none have been properly defined in dogs or cats.

**Small mammals:** Rodents: 20-40 mg/animal p.o prn.

**Birds:** No information available.

**Reptiles:** 100 mg/kg p.o. q24h.

---

**Aluminium hydroxide** see **Aluminium antacids**

**Amantadine** (Lysovir*, Symmetrel*) POM

**Formulations:** Oral: 100 mg capsule; 10 mg/ml syrup.

**Action:** Provides analgesia through NMDA antagonist action which may potentiate the effects of other analgesics.

**Use:** Adjunctive analgesic in animals that are unresponsive to opioids, or that require chronic pain relief in a home environment (e.g. osteoarthritis or cancer pain). To date there are no published studies in cats or dogs investigating the pharmacokinetics or pharmacodynamics. Amantadine has been widely used clinically in other countries, particularly in animals with osteoarthritis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In humans minor GI and CNS effects have been reported, although these have not been reported in animals.

**Drug interactions:** No information available.
DOSES

Dogs: 3.0 mg/kg q24h. The dose is based on anecdotal discussion and may not be appropriate for all animals.

Cats: 1.0-4.0 mg/kg q24h; start at the lowest dose and increase slowly.

Small mammals, Birds, Reptiles: No information available.

Amethocaine see Tetracaine

Amikacin (Amikacin*, Amikin*) POM

Formulations: Injectable: 50 mg/ml, 250 mg/ml solutions.

Action: Aminoglycosides inhibit bacterial protein synthesis. They are bactericidal and their mechanism of killing is concentration-dependent, leading to a marked post-antibiotic effect, allowing pulse-dosing regimens (which may reduce toxicity).

Use: Active against many Gram-negative bacteria including some that may be resistant to gentamicin. Its use is generally only indicated when sensitivity testing has been performed. Activity at low oxygen sites may be limited. Movement across biological membranes may also be limited, hence systemic levels require parenteral administration, and access to sites such as the CNS and ocular fluids is very limited. Monitoring serum amikacin levels should be considered to ensure therapeutic levels and minimize toxicity, particularly in neonates, geriatric patients and those with reduced renal function. Monitoring renal function is also advisable during treatment of any animal. Intravenous doses should be given slowly, generally over 30-60 min. Concurrent fluid therapy is advised.

Safety and handling: Normal precautions should be observed.

Contraindications: Can potentiate neuromuscular blockade so avoid use in combination with neuromuscular blocking agents. If possible avoid use in animals with reduced renal function. Use with caution in birds, as it is toxic.

Adverse reactions: Nephrotoxic and ototoxic.

Drug interactions: Synergism may occur in vivo when aminoglycosides are combined with beta-lactam antimicrobials. Avoid the concurrent use of other nephrotoxic, ototoxic or neurotoxic agents (e.g. amphotericin B, cisplatin, furosemide). Aminoglycosides may be inactivated in vitro by beta-lactam antibiotics (e.g. penicillins, cephalosporins) or heparin; do not give these drugs in the same syringe.

DOSES

Dogs, Cats: 5-10 mg/kg i.v., i.m., s.c. q8h or 10-15 mg/kg i.v., i.m., s.c. q24h (possibly less nephrotoxic and more in-line with
concentration-dependent effect). Doses up to 30 mg/kg i.v., i.m., s.c. q24h have been recommended by some authors for managing septic shock, although there is an increased risk of adverse effects with such high doses.

**Small mammals**: Ferrets: 8-16 mg/kg i.v., i.m., s.c. q8-24h; Rabbits: 2-10 mg/kg i.v., i.m., s.c. q8-12h; Rodents: 5-15 mg/kg i.v., i.m., s.c. q8-12h. Concurrent fluid therapy advised, especially if hydration status poor or uncertain.

**Birds**: 10-20 mg/kg i.m., s.c., i.v. q8-12h.

**Reptiles**: 5 mg/kg i.m. once, then 2.5 mg/kg i.m. q72h @ 25°C.

**Amiloride** (Amiloride Hydrochloride*) POM

**Formulations**: Oral: 5 mg tablets; 1 mg/ml solution. Also present in compound preparations with hydrochlorothiazide (Moduret, Moduretic) and furosemide (Frumil, Lasoride).

**Action**: Potassium-sparing weak diuretic which inhibits sodium absorption in the distal tubule and collecting duct. This leads to a failure of the normal renal concentration gradient.

**Use**: Oedema or ascites due to liver or heart failure. Often added to more potent diuretics such as furosemide in cases of refractory heart failure. Doses have not been widely reported in the veterinary literature.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Avoid in renal insufficiency, diabetes mellitus or hyperkalaemia.

**Adverse reactions**: Hypotension, hyperkalaemia and hyponatraemia may develop.

**Drug interactions**: Avoid the concomitant administration of potassium.

**DOSES**

**Dogs, Cats**: 0.1 mg/kg p.o. q12h is used in humans and has been suggested for dogs and cats.

**Small mammals, Birds, Reptiles**: No information available.

**Amino acid solutions** (Duphalyte, Aminoplasmal*, Aminoven*, Glamin*, Intrafusin*) POM

**Formulations**: Injectable: synthetic crystalline L-amino acid solutions for i.v. use only. Numerous human products are available, varying in concentration of essential amino acids. Some products also contain electrolytes.

**Action**: Support protein anabolism, arrest protein and muscle wasting, and maintain intermediary metabolism.
**Use:** Amino acid solutions supply essential and non-essential amino acids for protein production. They are used parenterally in patients requiring nutritional support. The authorized veterinary preparation contains insufficient amino acids to meet basal requirements for protein production and is intended as an aid for i.v. fluid support. None of the human formulations contains taurine, which is essential for cats and in specific conditions in dogs. Most products are hyperosmolar. The use of concentrated amino acid solutions for parenteral nutrition support should not be undertaken without specific training and requires central venous access and intensive care monitoring. Parenteral nutrition also needs to supply the patient’s requirements for fluids, essential electrolytes (sodium, potassium, magnesium, bicarbonate, calcium) and phosphate. Additionally if treatment is prolonged, vitamins and trace elements must also be given.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Dehydration, shock, electrolyte imbalances and inadequate oxygenation.

**Adverse reactions:** The main complications of parenteral nutrition are catheter-associated thrombophlebitis, bacterial colonization of the catheter and resulting bacteraemia and septicaemia. Potentially life-threatening electrolyte imbalances including hypophosphataemia may also be seen. Other metabolic complications associated with parenteral nutrition include hyperglycaemia, hypoglycaemia, hyperlipidaemia, hypercapnia, acid-base disturbances, and ‘refeeding syndrome’. Additionally, because solutions are hyperosmolar severe tissue damage can occur if they are extravasated.

**Drug interactions:** Consult specific product data sheet(s). Intravenous lines for amino acid solutions should be dedicated for that use alone and should not be used for other medications.

**DOSES**

- **Dogs:** 2-4 g protein/100 kcal (418 kJ) energy requirements.
- **Cats:** 3-6 g protein/100 kcal (418 kJ) energy requirements.
- **Small mammals, Birds, Reptiles:** No information available.

---

**Aminophylline** (Aminophylline*) POM

**Formulations:** Injectable: 25 mg/ml solution. Oral: 100 mg tablet. For modified-release preparations see Theophylline (100 mg of aminophylline is equivalent to 79 mg of theophylline).

**Action:** Thought to include: inhibition of phosphodiesterase enzyme, alteration of intracellular calcium, catecholamine release, and adenosine and prostaglandin antagonism.

**Use:** Spasmolytic agent and has a mild diuretic action. It is used to dilate bronchi and in the management of pulmonary oedema. Aminophylline is a stable mixture of theophylline and ethylenediamine. Theophylline has a low therapeutic index and should be dosed on a lean body weight basis.
Safety and handling: Normal precautions should be observed.
Contraindications: Aminophylline causes intense local pain when given i.m. and is very rarely used or recommended via this route. Administer with caution in patients with severe cardiac disease, gastric ulcers, hyperthyroidism, renal or hepatic disease, severe hypoxia or severe hypertension.
Adverse reactions: Adverse effects include nausea, vomiting, increased gastric acid secretion, diarrhoea, polyphagia, PU/PD and cardiac arrhythmias. Hyperaesthesia may be seen in cats. Most adverse effects are related to the serum level and may be symptomatic of toxic serum concentrations.
Drug interactions: Do not mix aminophylline in a syringe with other drugs. Agents that may increase the serum levels of theophylline include cimetidine, erythromycin and allopurinol. Phenobarbital may decrease the serum concentration of theophylline. Theophylline may decrease the effects of phenytoin and pancuronium. Theophylline and beta-adrenergic blockers (e.g. propranolol) may antagonize each other’s effects. Theophylline with halothane may cause an increased incidence of cardiac dysrhythmias and with ketamine an increased incidence of seizures.

DOSES
Dogs: 9-11 mg/kg i.m., p.o. q6-8h or slowly i.v. (diluted) for emergency bronchodilation.
Cats: 6.6 mg/kg p.o. q12h or 2-5 mg/kg slowly i.v. (diluted) for emergency bronchodilation.
Small mammals: Guinea pigs: 50 mg/kg p.o.
Birds: No information available.
Reptiles: 2-10 mg/kg i.m. once.

Amiodarone (Amiodarone*, Cordarone*) POM
Formulations: Oral: 100 mg, 200 mg tablets. Injectable: 50 mg/ml for dilution and use as an infusion.
Action: Prolongs the duration of the action potential in the atria and ventricles, inhibits sympathetic nervous system action, slows the sinus rate, prolongs sinus node recovery time, and prolongs the absolute and relative refractory periods in the atrioventricular (AV) node and His/Purkinje system.
Use: Chiefly used in dogs with symptomatic refractory ventricular arrhythmias. It may be useful in ventricular pre-excitation syndromes because it can prolong AV nodal and anomalous pathway absolute refractory periods. It has been successfully used for rate control or conversion to sinus rhythm in some dogs with atrial fibrillation. It has been used as an i.v. infusion in dogs with recent onset postoperative atrial fibrillation. It has slow GI absorption, a slow onset of action and a long elimination half-life. Because numerous side effects have been
documented in humans, its use is advised only where more familiar antiarrhythmics have failed. It may be advisable to perform liver and thyroid function tests every 4-6 months during therapy.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in dogs with sinus bradycardia, AV block or thyroid dysfunction.

**Adverse reactions:** Amiodarone causes bradycardia, AV block and prolongation of the QT interval. It is a negative inotrope and can cause hypotension. GI (vomiting) and systemic side effects (hypothyroidism, pulmonary fibrosis, corneal deposits) have been reported in humans. Anorexia, hepatotoxicity and positive Coombs’ test results have been reported in dogs. T4 level decreases with amiodarone administration, but clinically apparent hypothyroidism is rare.

**Drug interactions:** Amiodarone may significantly increase serum levels and/or pharmacological effects of anticoagulants, beta-blockers, calcium-channel blockers, ciclosporin, digoxin, lidocaine, methotrexate, procainamide, quinidine and theophylline. Cimetidine may increase serum levels of amiodarone.

**DOSES**

*Dogs:* Oral: 10-15 mg/kg p.o. q12h for 7 days, then 5-7.5 mg/kg p.o. q12h for 14 days; thereafter 7.5 mg/kg p.o. q24h. Intravenous: not well defined. Doses of 0.03-0.05 mg/kg/min have been administered as an infusion for several hours. Bolus administration of 2.5-5 mg/kg given very slowly i.v. has been used in ventricular tachycardia.

*Cats, Small mammals, Birds, Reptiles:* No information available.

**Amitraz** (Aludex) POM-V

**Formulations:** Topical: 5% w/v concentrated liquid.

**Action:** Increases neuronal activity through its action on octopamine receptors of mites.

**Use:** To treat generalized mite infestation, specifically canine demodicosis and sarcoptic acariasis. Dip to be left on coat. Clipping long hair coats will improve penetration. Concurrent bacterial skin infections should be treated appropriately. ‘Off-label’ use for generalized demodicosis in ferrets and hamsters and for acariasis in rodents.

**Safety and handling:** Do not store diluted product.

**Contraindications:** Do not use in dogs <3 months in Chihuahuas, cats or diabetic animals. Use with care in small dogs.

**Adverse reactions:** Sedation and bradycardia; can be reversed with an alpha-2 agonist, e.g. atipamezole, yohimbine. Can cause irritation of the skin.

**Drug interactions:** No information available.
DOSES

Dogs:

• Generalized demodicosis: 0.05% solution (1 ml concentrated liquid in 100 ml water) q5-7d until two negative skin scrapings/hair plucks are achieved 2 weeks apart.
• Sarcoptic acariasis: 0.025% solution (1 ml concentrated liquid in 200 ml water) weekly for 2-6 weeks.

Cats: Do not use.

Small mammals: Rodents: 0.007% solution: 1.4 ml concentrated liquid in 1000 ml water. Apply with a cotton bud q14d for 3-6 treatments.

Birds, Reptiles: No information available.

Amitriptyline (Amitriptyline*) POM

Formulations: Oral: 10 mg, 25 mg, 50 mg tablets; 5 mg/ml, 10 mg/ml solutions.

Action: Blocks noradrenaline and serotonin re-uptake in the brain, resulting in antidepressive activity.

Safety and handling: Normal precautions should be observed.

Contraindications: Hypersensitivity to tricyclic antidepressants, glaucoma, history of seizures or urinary retention, severe liver disease. Some caution and careful monitoring is warranted in patients with cardiac or renal disease.

Adverse reactions: Sedation, dry mouth, diarrhoea, vomiting, excitability, arrhythmias, hypotension, syncope, increased appetite, weight gain and, less commonly, seizures and bone marrow disorders have been reported in humans.

Drug interactions: Should not be used with monoamine oxidase inhibitors or drugs metabolized by cytochrome P450 2D6, e.g. chlorpheniramine, cimetidine.

DOSES

Dogs: 1-2 mg/kg p.o. q12-24h.

Cats: 0.5-1 mg/kg p.o. q24h.

Small mammals, Birds, Reptiles: No information available.

Amlodipine (Amlodipine*, Istin*) POM

Formulations: Oral: 5 mg, 10 mg tablets.

Action: Calcium-channel blocker, with predominant effects in the peripheral vasculature, which produces mild negative inotropic and chronotrophic effects.
**Amoxicillin (Amoxycillin)** (Amoxinsol, Amoxycare, Amoxival, Amoxypen, Bimoxyl, Clamoxyl, Duphamox, Vetremox) POM-V

**Formulations:** Injectable: 150 mg/ml suspension. Oral: 40 mg, 200 mg, 250 mg tablets; suspension which when reconstituted provides 50 mg/ml.

**Action:** Binds to penicillin-binding proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, affecting cell division, growth and septum formation. These antimicrobials act in a time-dependent bactericidal fashion.

**Use:** Active against certain Gram-positive and Gram-negative aerobic organisms and many obligate anaerobes but not against those that produce penicillinases (beta-lactamases), e.g. *Escherichia coli*, *Staphylococcus aureus*. The more difficult Gram-negative organisms (*Pseudomonas* spp., *Klebsiella* spp.) are usually resistant. Amoxicillin is excreted well in bile and urine. Oral amoxicillin may be given with or without food. Since amoxicillin works in a time-dependent fashion, it is important to maintain levels above the MIC for a high percentage of the time. In practical terms this means that dosing interval is critical and missing doses can seriously compromise efficacy. In ferrets is used in combination with bismuth subsalicylate, ranitidine or omeprazole and metronidazole (‘triple therapy’) for treatment of *Helicobacter mustelae* infection.
Safety and handling: Refrigerate oral suspension after reconstitution; discard if solution becomes dark or after 7 days.

Contraindications: Avoid oral antibiotics in critically ill patients, as absorption from the GI tract may be unreliable. Do not administer penicillins to hamsters, guinea pigs, gerbils, chinchillas or rabbits.

Adverse reactions: Nausea, diarrhoea and skin rashes are the commonest adverse effects.

Drug interactions: Avoid concurrent use with bacteriostatic antibiotics (e.g. tetracycline, erythromycin, chloramphenicol). Do not mix in the same syringe as aminoglycosides. A synergistic effect is seen when beta-lactam and aminoglycoside antimicrobials are used concurrently.

DOSES

**Dogs, Cats:** Parenteral: 7 mg/kg i.m. q24h; 15 mg/kg i.m. q48h for depot preparations.
Oral: 10 mg/kg p.o. q8-12h. (Doses of 16-33 mg/kg i.v. q8h are used in humans to treat serious infections.) Dose chosen will depend on site of infection, causal organism and severity of the disease.

**Small mammals:** Ferrets: 10-30 mg/kg s.c., p.o. q12h; Rats, Mice: 100-150 mg/kg i.m., s.c. q12h.

**Birds:** 150-175 mg/kg i.m., s.c. q8-12h (q24h for long-acting preparations); Parrots, Raptors: 150-175 mg/kg p.o. q12h; Pigeons: 1-1.5 g/l drinking water (Vetremox pigeon) q24h for 3-5 days or 100-200 mg/kg p.o. q6-8h; Waterfowl: 1 g/l drinking water (Amoxinsol soluble powder) alternate days for 3-5 days, 300-500 mg/kg soft food for 3-5 days; Passerines 1.5g/l drinking water (Vetremox pigeon).

**Reptiles:** 5-10 mg/kg i.m., p.o. q12-24h (most species); Chelonians: 5-50 mg/kg i.m., p.o. q12h.

**Amoxicillin/Clavulanate** *(Amoxycillin/Clavulanic acid)*

(Augmentin, Clavaseptin, Nisamox, Synulox) POM-V, POM

Formulations: Injectable: 175 mg/ml suspension (140 mg amoxicillin, 35 mg clavulanate); 600 mg powder (500 mg amoxicillin, 100 mg clavulanate); 1.2 g powder (1 g amoxicillin, 200 mg clavulanate) for reconstitution (Augmentin). Oral: 50 mg, 250 mg, 500 mg tablets each containing amoxicillin and clavulanate in a ratio of 4:1. Palatable drops which when reconstituted with water provide 40 mg amoxicillin and 10 mg clavulanic acid per ml.

Action: Amoxicillin binds to penicillin-binding proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, affecting cell division, growth and septum formation. The addition of the beta-lactamase inhibitor clavulanate increases the antimicrobial spectrum against those organisms that produce beta-lactamase, such as *Staphylococcus* spp.

Use: Active against Gram-positive and Gram-negative aerobic organisms and many obligate anaerobes. Penicillinase-producing *Escherichia coli* and *Staphylococcus* spp. are susceptible, but difficult
Gram-negative organisms such as *Pseudomonas aeruginosa* and *Klebsiella* spp. are often resistant. Dose and dosing interval will be determined by infection site, severity and organism.

**Safety and handling:** Tablets are wrapped in foil moisture-resistant packaging; do not remove until to be administered. Refrigerate oral suspension and i.v. solution after reconstitution. Discard oral suspension and i.v. formulation if they become dark or after 10 days. A small amount of discoloration of the i.v. solution is acceptable.

**Contraindications:** Avoid oral antibiotic agents in critically ill patients, as absorption from the GI tract may be unreliable; such patients may require i.v. formulation. Avoid use in animals which have displayed hypersensitivity reactions to other antimicrobials within the beta-lactam family (which includes cephalosporins). Do not administer to hamsters, guinea pigs, gerbils, chinchillas and rabbits.

**Adverse reactions:** Nausea, diarrhoea and skin rashes are the commonest adverse effects.

**Drug interactions:** Avoid the concurrent use of amoxicillin with bacteriostatic antibiotics (e.g. tetracycline, erythromycin). Do not mix in the same syringe as aminoglycosides. Do not use with allopurinol in birds. Synergism may occur between the beta-lactam and aminoglycoside antimicrobials *in vivo*.

**DOSES**

**Dogs, Cats:** Parenteral: 8.75 mg/kg (combined) i.v. q8h, i.m., s.c. q24h. Oral: 12.5-25 mg/kg (combined) p.o. q8-12h. (Doses up to 25 mg/kg i.v. q8h are used to treat serious infections in humans.)

**Small mammals:** Ferrets: 12.5-20 mg/kg i.m., s.c. q12h; Rats, Mice: 100 mg/kg q12h.

**Birds:** 125-150 mg/kg p.o., i.v. q12h; 125-150 mg/kg i.m. q24h.

**Reptiles:** No information available.

**Amoxycillin** see **Amoxicillin**

**Amphotericin B** (Abelcet*, AmBisome*, Amphocil*, Fungizone*) POM

**Formulations:** Injectable: 50 mg/vial powder for reconstitution.

**Action:** Binds to sterols in fungal cell membrane creating pores and allowing leakage of contents.

**Use:** Management of systemic fungal infections and leishmaniasis. Abelcet, AmBisome, Amphocil are lipid formulations that are less toxic. Physically incompatible with electrolyte solutions. Lipid formulations are far less toxic than conventional formulations for i.v. use because the drug is targeted to macrophages, but these preparations are far more expensive. Solutions are usually given i.v. but if regular venous catheterization is problematic then an i.m. alternative has been used for cryptococcosis and could potentially be used for other systemic mycoses.
Safety and handling: Keep in dark, although loss of drug activity is negligible for at least 8 hours in room light. After reconstitution the preparation is stable for 1 week if refrigerated and stored in the dark. Do not dilute in saline. Pre-treatment heating of the reconstituted concentrated solution to 70°C for 20 min produces superaggregates which are less nephrotoxic. To produce a lipid-formulated product if not commercially available mix 40 ml sterile saline, 10 ml of lipid infusion (q.v.) and 50 mg of the reconstituted concentrated solution.

Contraindications: Do not use in renal or hepatic failure. Amphotericin B is toxic to birds when administered systemically; administer fluids and monitor carefully if giving i.v.

Adverse reactions: Include hypokalaemia, leading to cardiac arrhythmias, phlebitis, hepatic failure, renal failure, vomiting, diarrhoea, pyrexia, muscle and joint pain, anorexia and anaphylactoid reactions. Nephrotoxicity is a major concern; do not use other nephrotoxic drugs concurrently. Risk of nephrotoxicity may be reduced if a fluid high in sodium is administered at the same time as Amphotericin B. Fever and vomiting may be decreased by pre-treating with aspirin, diphenhydramine or an antiemetic.

Drug interactions: Amphotericin may increase the toxic effects of cisplatin, fluorouracil, doxorubicin and methotrexate. Flucytosine is synergistic with amphotericin B in vitro against Candida, Cryptococcus and Aspergillus.

DOSES

Dogs, Cats:

- Systemic mycoses (intravenous): 0.25-1 mg/kg i.v. q24-48h. Administer slowly over 4-6 hours. Dilute the initial solution in 50 ml of 5% dextrose to give a final concentration of 0.1 mg/ml. Alternatively, 0.25-1 mg/kg may be dissolved in 5-20 ml of 5% dextrose and given rapidly i.v. 3 times a week. Start at the lower end of the dose range and increase gradually as the patient tolerates therapy. Several months of therapy are often necessary. A total cumulative dose of 4-8 mg/kg is recommended by some authors.

- Cryptococcosis (subcutaneous alternative): 0.5-0.8 mg/kg added to 400-500 ml of 0.45% saline/2.5% dextrose. This total volume is then administered s.c. 2 to 3 times a week to a cumulative level of 8–26 mg/kg. Do not inject solutions more concentrated than 20 mg/l as they will cause subcutaneous abscesses.

- Leishmaniasis (lipid-formulated products): 1-2.5 mg/kg i.v. twice weekly for 8 injections. Increase dose rate gradually. A total cumulative dose of at least 10 mg/kg is required but treatment may be continued long term depending on clinical response.

- Irrigation of bladder: 200 mg/l of sterile water infused at a rate of 5-10 ml/kg into the bladder lumen daily for 5-15 days.

Small mammals: Ferrets: 0.4-0.8 mg/kg i.v. q7d for treatment of blastomycosis; Rabbits: 1 mg/kg i.v. q24h; Mice: 0.11 mg/kg s.c. q24h, 0.43 mg/kg p.o. q24h.
**Birds:** Systemic fungal infections: 1-1.5 mg/kg i.v. q8-12h for 3-5 days (give with 10-15 ml/kg saline) or 1 mg/kg in 2 ml sterile water intratracheally q8-12h for 12 days then q48h for 5 weeks; Parrots: 100-300 mg/kg mg/kg p.o. q12-24h for *Macrorhabdus* infection; Passerines: 100,000 IU/kg p.o. q8-12h or 1-5 g/l drinking water) or 1 mg/ml in saline nebulized for 15 mins q12h.

**Reptiles:** 0.5-1 mg/kg i.v., intracoelomically q24-72h for 2-4 weeks; for respiratory infections nebulize 5 mg in 150 ml saline for 30-60 min; may also use topically on lesions q12h.

**Ampicillin** (Amfipen, Ampicaps, Ampicare, Duphacillin) POM-V

**Formulations:** Injectable: Ampicillin sodium 250 mg, 500 mg powders for reconstitution (human licensed product only); 150 mg/ml suspension, 100 mg/ml long acting preparation. Oral: 50 mg, 125 mg, 500 mg tablets; 250 mg capsule.

**Action:** Binds to penicillin-binding proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, affecting cell division, growth and septum formation. It acts in a time-dependent bactericidal fashion.

**Use:** Active against many Gram-positive and Gram-negative aerobic organisms and obligate anaerobes, but not against those that produce penicillinases (beta-lactamases), e.g. *Escherichia coli*, *Staphylococcus aureus*. The difficult Gram-negative organisms such as *Pseudomonas aeruginosa* and *Klebsiella* spp. are usually resistant. Ampicillin is excreted well in bile and urine. Maintaining levels above the MIC is critical for efficacy and thereby prolonged dosage intervals or missed doses can compromise therapeutic response. Dose and dosing interval is determined by infection site, severity and organism. Oral bioavailability is reduced in the presence of food.

**Safety and handling:** After reconstitution the sodium salt will retain adequate potency for up to 8 hours if refrigerated, but use within 2 hours if kept at room temperature.

**Contraindications:** Avoid the use of oral antibiotic agents in critically ill patients, as absorption from the GI tract may be unreliable. Do not administer penicillins to hamsters, guinea pigs, chinchillas or rabbits. Use with caution in gerbils and only when indicated by sensitivity testing.

**Adverse reactions:** Nausea, diarrhoea and skin rashes are the commonest adverse effects.

**Drug interactions:** Avoid the concurrent use of ampicillin with bacteriostatic antibiotics (e.g. tetracycline, erythromycin, chloramphenicol). Do not mix in the same syringe as aminoglycosides.

A synergistic effect is seen when beta-lactam and aminoglycoside antimicrobials are used concurrently.
DOSES

**Dogs:** Routine infections: 10-20 mg/kg i.v., i.m., s.c., p.o. q6-8h. CNS or serious bacterial infections: up to 40 mg/kg i.v. q6h has been recommended.

**Cats:** 10-20 mg/kg i.v., i.m., s.c., p.o. q6-8h.

**Small mammals:** Ferrets: 5-30 mg/kg i.m., s.c. q12h; Rabbits, Chinchillas, Guinea pigs, Hamsters: do not use; Gerbils: 20-100 mg/kg s.c. q8h, 6-30 mg/kg p.o. q8h; Rats, Mice: 25 mg/kg i.m., s.c. q12h, 50-200 mg/kg p.o. q12h.

**Birds:** 50-100 mg/kg i.v., i.m. q8-12h, 150-200 mg/kg p.o. q8-12h, 1-2 g/l drinking water, 2-3 g/kg soft feed.

**Reptiles:** 20 mg/kg s.c., i.m. q24h @ 26°C.

---

**Amprolium** (Coxoid) AVM-GSL

**Formulations:** Oral: 3.84% solution for dilution in water.

**Action:** Thiamine analogue that disrupts protozoal metabolism.

**Use:** Coccidiosis in homing/racing pigeons. Has been used for coccidiosis in dogs and cats. Limit duration of therapy to 2 weeks.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Anorexia, diarrhoea and depression in dogs. Prolonged high doses can cause thiamine deficiency.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 300-400 mg/dog p.o. q24h for 5 days. Use lower end of dose in puppies.

**Cats:** 300-400 mg/cat p.o. q24h.

**Birds:** Pigeons: 28 ml of the concentrate in 4.5 l of drinking water for 7 days; in severe outbreaks continue with half-strength solution for a further 7 days; medicated water should be discarded after 24 hours. Passerines: 50-100 mg/l drinking water for 5 days or longer.

**Small mammals, Reptiles:** No information available.

---

**Antivenom (European Adder)** POM

**Formulations:** Injectable: 10 ml vial for injection.

**Action:** Immunoglobulin raised against venom inhibits toxic effects.

**Use:** Used in the management of snake bites by the European Adder (Viper). The current supplier can be found on the internet. The value of antivenom decreases with time following the bite. There are no published studies on efficacy in small animals. This antivenom is unlikely to work for other snake bites and specialist help should be urgently sought for such bites.
Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: Anaphylactic reactions may develop.
Drug interactions: No information available.

DOSES

**Dogs, Cats:** 10 ml concentrated antivenom per animal, diluted in 5 ml of 0.9% NaCl per kg body weight. Administer by i.v. infusion over 30 min or i.v. injection over 10-15 min. Repeat after 1-2 hours if signs persist.

**Small mammals, Birds, Reptiles:** No information available.

---

**Apomorphine** (APO-go*) POM

**Formulations:** Injectable: 10 mg/ml solution in 2 ml or 5 ml ampoules; 5 mg/ml, 10 mg/ml solutions in 10 ml pre-filled syringes.

**Action:** Stimulates emesis through D2 dopamine receptors in the chemoreceptor trigger zone.

**Use:** Induction of self-limiting emesis within a few minutes of administration in dogs where vomiting is desirable, e.g. following the ingestion of toxic, non-caustic foreign material. Emesis generally occurs rapidly and within a maximum of 10 min. Further doses depress the vomiting centre and may not result in any further vomiting. Must not be administered i.v.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Induction of emesis is contraindicated if strong acid or alkali has been ingested, due to the risk of further damage to the oesophagus. Induction of vomiting is contraindicated if the dog is unconscious, fitting, or has a reduced cough reflex, or if the poison has been ingested for >2 hours, or if the ingesta contains paraffin, petroleum products or other oily or volatile organic products, due to the risk of inhalation.

**Adverse reactions:** Apomorphine may induce excessive vomiting, respiratory depression and sedation.

**Drug interactions:** In the absence of compatibility studies, apomorphine must not be mixed with other products.

**DOSES**

**Dogs:** 40-100 µg/kg s.c., i.m. (s.c. route is more effective).

**Cats:** Not recommended; xylazine is a potent emetic in cats and at least as safe.

**Small mammals, Birds, Reptiles:** No information available.

---

**Appeasines** see Dog appeasing pheromone
Apraclonidine (Iopidine*) POM

**Formulations:** Ophthalmic: 0.5% solution (5 ml bottle); preservative-free 1% solution (single-dose vials).

**Action:** Topical alpha-2-selective agonist that decreases aqueous humour production via inhibition of adenylate cyclase activity in the ciliary body.

**Use:** Reducing intraocular pressure in glaucoma. However, effect in dogs is inconsistent and it is unlikely to be effective as the sole agent in most forms of canine glaucoma. It may be most useful in alleviating pressure rises after intraocular surgery. It is prudent to monitor heart rate before and after topical application of apraclonidine, particularly with initial use and in small dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Commercial preparations are considered too toxic for use in cats. Do not use in dogs with uncontrolled cardiac disease.

**Adverse reactions:** Causes blanching of conjunctival vessels and bradycardia in dogs and cats. Causes mydriasis in dogs, miosis and severe vomiting in cats.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 1 drop per eye q8h for short-term use only.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

---

Ara-C see Cytarabine

---

Arnica (Arnicare*) GSL

**Formulations:** Arnica montana tincture 0.9% w/v.

**Action:** Arnica montana is an alpine plant that contains helenalin, which has anti-inflammatory properties.

**Use:** First aid application for bruises resulting from a number of causes but especially those resulting from extravasation of non-toxic fluids from intravenous catheters. Also useful for peri-surgical bruising. Arnica has been found to be as effective as some NSAIDs (e.g. ibuprofen) in humans with hand arthritis and in reducing bruising following facelift surgery. However, some studies have shown no effect over placebo. No anti-infective properties; therefore skin infections require other specific therapy.

**Safety and handling:** Wear gloves when applying cream as contact with the plant can cause skin irritation in some individuals.

**Contraindications:** Do not apply to broken skin.
Adverse reactions: Ingestion of large amounts of the plant can be poisonous. There are no reports of problems associated with the cream.

Drug interactions: No information available.

DOSES
Dogs, Cats: Apply sparingly to site of bruising twice daily.
Small mammals, Birds, Reptiles: No information available.

Ascorbic acid see Vitamin C
Asparaginase, L-Asparginase see Crisantaspase

**Aspirin** (Acetylsalicylic acid) (Aspirin BP* and component of many others) P

Formulations: Oral: 75 mg, 300 mg tablets.

Action: Produces irreversible inhibition of cyclo-oxygenase (COX) by acetylation, thereby preventing the production of both prostaglandins and thromboxanes from membrane phospholipids.

Use: Prevent arterial thromboembolism. Also can be used to control mild to moderate pain, although NSAIDs that are more selective for the COX-2 enzyme have a better safety profile. Aspirin is not an NSAID of choice for analgesia in dogs or cats.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not give aspirin to dehydrated, hypovolaemic or hypotensive patients or those with GI disease. Administration of aspirin to animals with renal disease must be carefully evaluated. It is advisable to stop aspirin before surgery (at least 2 weeks) to allow recovery of normal platelet function and prevent excessive bleeding. Do not give to pregnant animals or animals <6 weeks.

Adverse reactions: GI ulceration and irritation are common side effects of all NSAIDs. It is advisable to stop therapy if diarrhoea or nausea persists beyond 1-2 days. Stop therapy immediately if GI bleeding is suspected and begin symptomatic treatment. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease. All NSAIDs carry a risk of renal papillary necrosis due to reduced renal perfusion caused by a reduction in the production of renal prostaglandins. This risk is greatest when NSAIDs are given to animals that are hypotensive or animals with pre-existing renal disease.

Drug interactions: Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES
Dogs: Doses of aspirin in dogs are anecdotal and range from 10 mg/kg to 20 mg/kg q12h. The safety and efficacy of this dose has not been established.
**Cats:** Doses of 10-25 mg/kg q48h have been suggested for the prevention of thromboembolism; this equates to 1/4 of a 300 mg tablet for an average sized cat p.o. 3 days a week. Some authors suggest a very low dose (0.5 mg/kg q24h) to inhibit platelet COX without preventing the beneficial effects of prostacyclin production. The safety and efficacy of these different doses have not been evaluated in clinical or experimental studies.

**Small mammals:** Rodents: 50-150 mg/kg p.o. q4-8h.

**Birds:** Parrots: 5 mg/kg p.o. q8h, 325 mg/250 ml drinking water.

**Reptiles:** No information available.

**Atenolol** (Atenolol*, Tenormin*) POM

**Formulations:** Oral: 25 mg, 50 mg, 100 mg tablets; 5 mg/ml syrup.

**Action:** Blocks the chronotropic and inotropic effects of beta-adrenergic stimulation, thereby slowing the heart. Its bronchoconstrictor, vasodilatory and hypoglycaemic effects are less marked. At levels in excess of therapeutic doses atenolol has a quinidine-like stabilizing effect on the heart.

**Use:** Cardiac arrhythmias (atrial fibrillation, supraventricular tachycardia), hyperthyroidism, hypertrophic cardiomyopathy (cats), obstructive cardiac disease (severe aortic or pulmonic stenosis) and systemic hypertension. For supraventricular or ventricular arrhythmias, often added to other antiarrhythmic drugs, especially mexilite. Unlikely to be effective for ventricular arrhythmias when used alone. It is recommended to withdraw therapy gradually in patients who have been receiving the drug chronically.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Patients with supraventricular bradycardia and atrioventricular (AV) block and relatively contraindicated in animals with congestive heart failure.

**Adverse reactions:** Most frequently seen in geriatric patients with chronic heart disease or in patients with rapidly decompensating cardiac failure. Include bradycardia, impaired AV conduction, myocardial depression, heart failure, syncope, glucose intolerance, bronchospasm, diarrhoea and peripheral vasoconstriction. Depression and lethargy may occur as a result of atenolol’s high lipid solubility and its penetration into the CNS.

**Drug interactions:** As the beta effects of sympathomimetics (e.g. adrenaline, phenylpropanolamine, terbutaline) may be blocked by atenolol, the unopposed alpha effects may result in severe hypertension and a decreased heart rate. The hypotensive effect of atenolol is enhanced by anaesthetic agents that depress myocardial activity, phenothiazines, antihypertensive drugs (e.g. hydralazine, prazosin), diazepam, diuretics and other antiarrhythmics. There is an increased risk of severe hypotension, heart failure and AV block if atenolol is used with calcium-channel blockers (e.g. diltiazem,
verapamil). Concurrent digoxin administration potentiates bradycardia. The metabolism of atenolol is accelerated by thyroid hormones; thus the dose of atenolol may need to be decreased when initiating carbimazole therapy. Atenolol enhances the effects of muscle relaxants (e.g. suxamethonium, tubocurarine). Hepatic enzyme induction by phenobarbital may increase the rate of metabolism of atenolol. The bronchodilatory effects of theophylline may be blocked by atenolol. In patients with diabetes mellitus, insulin requirements should be monitored as atenolol may enhance the hypoglycaemic effect of insulin.

**DOSES**

*Dogs*: 0.5-2 mg/kg p.o. q12h; the lower dose is often used initially with gradual titration upwards if necessary.

*Cats*: 6.25-12.5 mg/cat p.o. q24h initially, increasing to q12h after a week if necessary.

*Small mammals, Birds, Reptiles*: No information available.

---

**Atipamezole** (Antisedan) POM-V

**Formulations**: Injectable: 5 mg/ml solution.

**Action**: Selective alpha-2 adrenoreceptor antagonist.

**Use**: Reverses the sedative effects of medetomidine; will also reverse other alpha-2 agonists to provide a quick recovery from anaesthesia and sedation. It also reverses other effects such as the analgesic, cardiovascular and respiratory effects of alpha-2 agonists. Atipamezole does not alter the metabolism of medetomidine but occupies the alpha-2 receptor preventing binding of medetomidine. The duration of action of atipamezole and medetomidine are similar, so re-sedation is uncommon. However, re-sedation may occur when atipamezole is given after romifidine (longer action). Atipamezole should not be administered until at least 45 min after medetomidine/ketamine combinations have been given to cats, to avoid CNS excitation in recovery. Note: When alpha-2-mediated cardiovascular collapse is imminent, atipamezole may be given i.v. See Sedation protocols in Appendix.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Atipamezole has been administered to a limited number of pregnant dogs and cats and therefore cannot be recommended in pregnancy. Routine administration of atipamezole i.v. is not recommended because the rapid recovery from sedation is usually associated with excitation, though i.v. administration may be indicated in an emergency (e.g. excessive sedation from medetomidine or cardiovascular complications).

**Adverse reactions**: Transient over-alertness and tachycardia may be observed after overdosage. This is best handled by minimizing external stimuli and allowing the animal to recover quietly.

**Drug interactions**: No information available.
DOSES

**Dogs:** Five times the previous medetomidine dose (in mg/kg) i.m.; i.e. equal volume to medetomidine. When medetomidine has been administered at least an hour before, dose of atipamezole can be reduced by half (i.e. half the volume of medetomidine), and repeated if recovery is slow.

**Cats:** Two and a half times the previous medetomidine dose (in mg/kg) i.m.; i.e. half the volume of medetomidine given.

**Small mammals:** Rodents: 1 mg/kg i.m., i.p., s.c.; Mice 1-2.5 mg/kg i.p.; Other: 1 mg/kg i.m., i.p., s.c.

**Birds:** 0.065 -0.25 mg/kg i.m.

**Reptiles:** Five times the previous medetomidine dose (mg/kg) i.m., i.v.

---

**Atracurium** (Tracrium*) POM

**Formulations:** Injectable: 10 mg/ml solution.

**Action:** Inhibits the actions of acetylcholine at the neuromuscular junction by binding competitively to the nicotinic acetylcholine receptor on the post-junctional membrane.

**Use:** Neuromuscular blockade during anaesthesia. This may be to improve surgical access through muscle relaxation, to facilitate positive pressure ventilation or for intraocular surgery. Atracurium has an intermediate duration of action (15-35 min) and is non-cumulative due to non-enzymatic (Hofmann) elimination). It is therefore suitable for administration to animals with renal or hepatic disease. Monitoring (using a nerve stimulator) and reversal of the neuromuscular blockade is recommended to ensure complete recovery before the end of anaesthesia. Hypothermia, acidosis and hypokalaemia will prolong the duration of action of neuromuscular blockade.

**Safety and handling:** Store in refrigerator.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available.

**Adverse reactions:** Can precipitate the release of histamine after rapid i.v. administration, resulting in bronchospasm and hypotension. Diluting the drug in normal saline and giving the drug slowly i.v. minimizes these effects.

**Drug interactions:** Neuromuscular blockade is more prolonged when atracurium is given in combination with volatile anaesthetics, aminoglycosides, clindamycin or lincomycin.

**DOSES**

**Dogs, Cats:** 0.5 mg/kg initially, followed by increments of 0.2 mg/kg i.v.

**Small mammals, Birds, Reptiles:** No information available.
Atropine (Atrocare) POM-V

Formulations: Injectable: 0.6 mg/ml. Ophthalmic: 0.5%, 1% solution in single-use vials, 5 ml bottle; 1% ointment.

Action: Blocks the action of acetylcholine at muscarinic receptors at the terminal ends of the parasympathetic nervous system, reversing parasympathetic effects and producing mydriasis, tachycardia, bronchodilation and general inhibition of GI function.

Use: Prevent or correct bradycardia and bradyarrhythmias, to dilate pupils, in the management of organophosphate and carbamate toxicities, and in conjunction with anticholinesterase drugs during antagonism of neuromuscular block. Routine administration prior to anaesthesia as part of premedication is no longer recommended; it is better to monitor heart rate and give atropine to manage a low heart rate if necessary. Atropine has a slow onset of action (10 min i.m., 2-3 min i.v.), therefore it is important to wait for an adequate period of time for the desired effect before redosing. The ophthalmic solution tastes very bitter and can cause hypersalivation in cats (and some dogs); therefore the ophthalmic ointment preparation is preferred.

Safety and handling: The solution does not contain any antimicrobial preservative, therefore any remaining solution in the vial should be discarded after use. The solution should be protected from light.

Contraindications: Glaucoma and lens luxation, as atropine increases intraocular pressure. Atropine reduces tear production and therefore should be avoided in animals with keratoconjunctivitis sicca.

Adverse reactions: Include sinus tachycardia (usually of short duration after i.v. administration), blurred vision from mydriasis, which may worsen recovery from anaesthesia, and drying of bronchial secretions. Ventricular arrhythmias may be treated with lidocaine if severe. Other GI side effects such as ileus and vomiting are rare in small animals.

Drug interactions: Atropine is compatible (for at least 15 min) mixed with various medications but not with bromides, iodides, sodium bicarbonate, other alkalis or noradrenaline. The following may enhance the activity of atropine: antihistamines, procainamide, quinidine, pethidine, benzodiazepines, phenothiazines, thiazide diuretics and sympathomimetics. Combining atropine and alpha-2 agonists is not recommended. Atropine may aggravate some signs seen with amitraz toxicity, leading to hypertension and gut stasis.

DOSES

Dogs, Cats:
- Ophthalmic: 1 drop or a small amount of ointment in the affected eye q8-12h to cause mydriasis, then once q24-72h to maintain mydriasis.
- Bradyarrhythmias: 0.02-0.04 mg/kg i.v. Low doses may exacerbate bradycardia; repetition of the dose will usually promote an increase in heart rate. 0.03-0.04 mg/kg i.m. can be given to prevent development of bradycardia during administration of potent opioids such as fentanyl.
• Organophosphate poisoning: dose 0.2-0.5 mg/kg (1/4 dose i.v, 3/4 i.m., s.c.) to effect; repeat as necessary; or 0.1-0.2 mg/kg (1/2 i.v., 1/2 i.m.) then i.m. q6h.
• Neuromuscular blockade antagonism: 0.04 mg/kg with edrophonium (0.5-1.0 mg/kg).

**Small mammals**: 0.04-0.1 mg/kg i.m., s.c.; Rabbits: endogenous atropinase levels may make repeated injections q10-15min necessary; Rodents: OP poisoning may require up to 10 mg/kg q20 min.

**Birds**:
• Pre-anaesthetic: 0.02-0.08 mg/kg i.m.
• Organophosphate poisoning: 0.04-0.5 mg/kg i.v., i.m. q4h
• Supraventricular tachycardia: 0.01-0.02 mg/kg i.v. once.

**Reptiles**: 0.01-0.04 mg/kg i.m., i.v.

---

**Azathioprine** (Azathioprine*, Imuran*) POM

**Formulations**: Oral: 25 mg, 50 mg tablets.

**Action**: Inhibits purine synthesis, which is necessary for cell proliferation especially of leucocytes and lymphocytes. It suppresses cell-mediated immunity, alters antibody production and inhibits cell growth.

**Use**: Management of immune-mediated diseases.

**Safety and handling**: Disposable gloves should be worn to handle/ administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites and should be handled with care.

**Contraindications**: Should not be used in patients with bone marrow suppression or those at high risk of infection.

**Adverse reactions**: Bone marrow suppression is the most serious adverse effect. This may be influenced by the activity of thiopurine s-methyltransferase, which is involved in the metabolism of the drug and which can vary between individuals due to genetic polymorphism. Cats in particular often exhibit a reaction that results in a severe, non-responsive fatal leucopenia and thrombocytopenia. Its use in cats cannot be recommended. In animals with renal impairment, the dosing interval should be extended.

**Drug interactions**: Enhanced effects and increased azathioprine toxicity when used with allopurinol.

**DOSES**

- **Dogs**: 2 mg/kg p.o. q24h until remission achieved then 0.5-2 mg/kg p.o. q48h. Often used in conjunction with corticosteroid therapy.
- **Cats**: Not recommended.
- **Small mammals, Birds, Reptiles**: No information available.
Azidothymidine  see Zidovudine

Azithromycin  (Zithromax*) POM

Formulations: Oral: 250 mg capsule; 200 mg/5 ml suspension (reconstitute with water).

Action: Binds to the 50S bacterial ribosome (like erythromycin), inhibiting peptide bond formation and has bactericidal or bacteriostatic activity depending on the susceptibility of the organism. Azithromycin has a longer tissue half-life than erythromycin, shows better oral absorption and is better tolerated in humans.

Use: Alternative to penicillin in allergic individuals as it has a similar, although not identical, antibacterial spectrum. It is active against Gram-positive cocci (some Staphylococcus spp. are resistant), Gram-positive bacilli, some Gram-negative bacilli (Haemophilus and Pasteurella spp.), mycobacteria, obligate anaerobes, Chlamyphilia spp., Mycoplasma spp. and Toxoplasma. Some strains of Actinomyces, Nocardia and Rickettsia are also inhibited. Most strains of the Enterobacteriaceae (Pseudomonas spp., Escherichia coli, Klebsiella spp.) are resistant. Useful in the management of respiratory tract, mild to moderate skin and soft tissue, and non-tubercular mycobacterial infections. It has not proved possible to eliminate C. felis from chronically infected cats using azithromycin, even with once daily administration. Little information is available on the use of this drug in animals and drug pharmacokinetics have not been studied closely in the dog and cat. Doses are empirical and subject to change as experience with the drug is gained. More work is needed to optimize the clinically effective dose rate. Azithromycin activity is enhanced in an alkaline pH; administer on an empty stomach.

Safety and handling: Normal precautions should be observed.

Contraindications: Use with great care in animals with hepatic dysfunction. Reduce dose in animals with renal impairment.

Adverse reactions: In humans similar adverse effects to those of erythromycin are seen, i.e. vomiting, cholestatic hepatitis, stomatitis and glossitis, but the effects are generally less marked than with erythromycin.

Drug interactions: Azithromycin may increase the serum levels of methylprednisolone, theophylline and terfenadine. The absorption of digoxin may be enhanced.

DOSES

Dogs: 5-10 mg/kg p.o. q12-24h.

Cats: 5 mg/kg p.o. q48h.

Small mammals: Rats: 10-20 mg/kg p.o. q12h for 14 days.

Birds: 50 mg/kg p.o. q24h. Chlamyphilia is requires therapy for 45 days.

Reptiles: 10 mg/kg p.o. q3d for skin infections; q5d for respiratory tract infections; q7d for liver and kidney infections.
**AZT** see Zidovudine

**Benazepril** (Fortekor) POM-V  
**Formulations:** Oral: 2.5 mg, 5 mg, 20 mg tablets.  
**Action:** Inhibits conversion of angiotensin I to angiotensin II, which results in veno- and arteriodilation and decreased salt and water retention (reduced aldosterone production). In the kidney, due to efferent arteriolar dilation resulting in a reduced glomerular filtration pressure, proteinuria may be reduced.  
**Use:** Reduce afterload on the heart when there is cardiac insufficiency and to reduce blood pressure in hypertension. It may be of benefit in certain cases of renal disease, particularly protein-losing glomerulopathies. Often used in conjunction with diuretics and other drugs in cases of heart failure. Less potent in reducing blood pressure compared with amlodipine in cats but sometimes used together as antihypertensives. Benazepril is rapidly converted by the liver to the active drug benazeprilat. Unlike enalapril, benazepril has significant hepatic metabolism and may not need dose adjustment in renal failure.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** Monitor blood pressure carefully when used in cases of severe heart failure. Use cautiously if sodium depletion is present.  
**Adverse reactions:** Potential adverse effects include hypotension, hyperkalaemia and renal impairment. Anorexia, vomiting and diarrhoea are rare. Dosage should be reduced if there are signs of hypotension (weakness, disorientation). Although no teratogenic effects have been reported, it is not recommended for breeding dogs, or pregnant or lactating bitches, as it apparently crosses the placenta and enters milk.  
**Drug interactions:** Concomitant usage with potassium-sparing diuretics, e.g. spironolactone, or potassium supplements could result in hyperkalaemia. There may be an increased risk of nephrotoxicity when used with NSAIDs. Concomitant administration of other antihypertensives can cause hypotension.  
**DOSES**  
**Dogs:** Heart failure: 0.25-0.5 mg/kg p.o. q24h.  
**Cats:** Chronic renal insufficiency: 0.5-1.0 mg/kg p.o. q24h.  
**Small mammals:** Rabbits: 0.25-0.5 mg/kg p.o. q24h.  
**Birds, Reptiles:** No information available.

**Benzoyl peroxide** (Paxcutol) POM-V  
**Formulations:** Topical: 2.5% shampoo.  
**Action:** Antimicrobial and keratolytic.
**Use:** Topical treatment of bacterial skin infections in dogs. Concurrent systemic antibacterial therapy is generally advised. Leave in contact with the skin for 5-10 min prior to washing off.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** May irritate mucous membranes. Can bleach some fabrics.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** To be used as a shampoo 2-3 times weekly. May be used less frequently once infection is controlled.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Benzyl penicillin** see **Penicillin G**

**Betamethasone** (Betnesol*, Betsolan, Fuciderm, Maxidex*, Norbet, Oterna, Vetsovate) POM-V, POM

**Formulations:** Injectable: 2 mg/ml suspension for i.m. use; 2 mg/ml solution for i.v. use. Oral: 0.25 mg tablet. Ophthalmic/Otic: 0.1% betamethasone solution. Betamethasone is also present in varying concentrations in several topical preparations with or without antibacterials.

**Action:** Alters the transcription of DNA, leading to alterations in cellular metabolism which causes reduction in inflammatory responses. Has high glucocorticoid but low mineralocorticoid activity. Betamethasone also antagonizes insulin and ADH.

**Use:** Short-term relief of many inflammatory but non-infectious conditions. Betamethasone has a long duration of activity and therefore is not suitable for long-term daily or alternate-day use. It has an anti-inflammatory potency 8.75 times greater than prednisolone. On a dose basis, 0.12 mg betamethasone is equivalent to 1 mg prednisolone. Prolonged use of glucocorticoids suppresses the hypothalamic–pituitary axis, resulting in adrenal atrophy. Animals on chronic corticosteroid therapy should be given tapered decreasing doses when discontinuing the drug.

**Safety and handling:** Wear gloves when applying cream.

**Contraindications:** Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus. Impaired wound healing and delayed recovery from infections may be seen. Topical corticosteroids are contraindicated in ulcerative keratitis. Use glucocorticoids with care in rabbits as they are a corticosteroid-sensitive species and even small single doses can cause severe pathological changes.
**Adverse reactions:** Catabolic effects of glucocorticoids lead to weight loss and cutaneous atrophy. Iatrogenic hyperadrenocorticism may develop. Vomiting, diarrhoea and GI ulceration may develop. Glucocorticoids may increase glucose levels and decrease serum T3 and T4 values. Corticosteroids should be used with care in birds as there is a high risk of immunosuppression and side effects, such as hepatopathy and a diabetes mellitus-like syndrome.

**Drug interactions:** There is an increased risk of GI ulceration if used concurrently with NSAIDs. Glucocorticoids antagonize the effect of insulin. Phenobarbital and primidone may accelerate the metabolism of corticosteroids. There is an increased risk of hypokalaemia when used concurrently with acetazolamide, amphotericin and potassium-depleting diuretics (furosemide, thiazides).

**DOSES**

**Dogs:**
- Ocular: 1 drop of ophthalmic solution to affected eye q6-8h.
- Skin: Apply cream to affected area q8-12h.
- Shock: 0.08 mg/kg i.v. once.
- Anti-inflammatory: 0.04 mg/kg i.v., i.m. q3w prn for up to 4 injections, 0.025 mg/kg p.o. q24h.

**Cats:**
- Ocular: dose as for dogs.
- Skin: dose as for dogs.
- Anti-inflammatory: 0.04 mg/kg i.v. q3w prn for up to 4 injections.

**Small mammals:** 0.1 mg/kg s.c. q24h.

**Birds, Reptiles:** No information available.

**Betaxolol** (Betoptic*) POM

**Formulations:** Ophthalmic: 0.25%, 0.5% solution; 0.25% suspension in single-use vials.

**Action:** Betaxolol is a beta-1 selective beta-blocker that decreases aqueous humour production via beta-adrenoreceptor blockade in the ciliary body.

**Use:** Management of glaucoma. It can be used alone or in combination with other topical glaucoma drugs, such as a topical carbonic anhydrase inhibitor. Betaxolol can be used in the prophylactic management of glaucoma in the other eye of dogs with unilateral primary closed angle glaucoma.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in uncontrolled heart failure and asthma.

**Adverse reactions:** Ocular adverse effects include miosis, conjunctival hyperaemia and local irritation.
Drug interactions: Additive adverse effects may develop if given concurrently with oral beta-blockers. Concomitant administration of timolol with verapamil may cause a bradycardia and asystole. Prolonged atrioventricular conduction times may result if used with calcium antagonists or digoxin.

DOSES

**Dogs:** 1 drop per eye q12h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Bethanecol** (Myotonine*) POM

**Formulations:** Oral: 10 mg, 25 mg tablets.

**Action:** A muscarinic agonist (cholinergic or parasympathomimetic) that increases urinary bladder detrusor muscle tone and contraction

**Use:** Management of urinary retention with reduced detrusor tone. It does not initiate a detrusor reflex and is ineffective if the bladder is areflexic. Best given on an empty stomach to avoid GI distress.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use when urethral resistance is increased unless in combination with agents that reduce urethral outflow pressure (e.g. phenoxybenzamine).

**Adverse reactions:** Vomiting, diarrhoea, GI cramping, anorexia, salivation and bradycardia (with overdosage). Treat overdoses with atropine.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 5-25 mg/dog p.o. q8h.

**Cats:** 1.25-5 mg/cat or 0.1-0.2 mg/kg p.o. q8h.

**Small mammals:** Rabbits: 2.5-5 mg/kg p.o. q12h.

**Birds, Reptiles:** No information available.

**Bisacodyl** (Dulco-Lax*) GSL, P

**Formulations:** Oral: 5 mg yellow, enteric-coated tablet. Rectal: 10 mg suppository.

**Action:** Mild stimulant laxative that increases intestinal motility, but inhibits absorption of water. It is locally active with <5% systemic absorption.

**Use:** Constipation. Doses are empirical; none have been defined in the veterinary literature.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Must not be used in patients with ileus, intestinal obstruction or dehydration.
Adverse reactions: Abdominal discomfort and diarrhoea.

Drug interactions: No information available.

DOSES

Dogs: 5-20 mg/dog prn.
Cats: 2-5 mg/cat prn.

Small mammals, Birds, Reptiles: No information available.

Bismuth salts (Bismuth carbonate, subnitrate and subsalicylate: tri-potassium di-citrate bismuthate (bismuth chelate)) (BCK granules, De-Noltab*, Pepto-Bismol*) AVM-GSl, P

Formulations: Oral: BCK; granules containing 39.2 mg/g bismuth subnitrate + 49 mg/g calcium phosphate + 400 mg/g charcoal + 422 mg/g kaolin. De-Noltab: tablets containing the equivalent of 120 mg bismuth oxide. Pepto-Bismol: bismuth subsalicylate suspension.

Action: Bismuth is a gastric cytoprotectant with activity against spiral bacteria. Bismuth chelate is effective in healing gastric and duodenal ulcers in humans, due to its direct toxic effects on gastric Helicobacter pylori and by stimulating mucosal prostaglandin and bicarbonate secretion. It is often used in conjunction with an H2 receptor antagonist. Bismuth subsalicylate has a mild anti-inflammatory effect.

Use: Acute oral poisoning, gastric ulceration and flatulent diarrhoea. Doses for products other than BCK are empirical; none have been defined in dogs and cats.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use where specific oral antidotes are being administered in cases of poisoning. Do not use if the patient is unconscious, fitting, or has a reduced cough reflex, or in cases of intestinal obstruction, or where enterotomy or enterectomy is to be performed. Pepto-Bismol should be used with caution in cats due to its subsalicylate content.

Adverse reactions: Avoid long-term use (except chelates) as absorbed bismuth is neurotoxic. Bismuth chelate is contraindicated in renal impairment. Nausea and vomiting reported in humans.

Drug interactions: Absorption of tetracyclines is reduced by bismuth and specific antidotes may also be affected.

DOSES

Dogs: BCK: 1-3 heaped teaspoons (~5 ml, 6 g) p.o. q8-12h. De-Noltab: 1/2 tab p.o. q6h (dogs up to 30 kg), 1 tab p.o. q6h (>30 kg). Pepto-Bismol: 1 ml/kg p.o. q4-6h.

Cats: BCK: 1-3 heaped teaspoons (~5 ml, 6 g) p.o. q8-12h. De-Noltab: 1/2 tab p.o. q6h. Pepto-Bismol: 1 ml/kg p.o. q4-6h – use with caution.

Small mammals: Ferrets: Pepto-Bismol: 0.25-1.0 ml/kg p.o. q4-8h.

Birds, Reptiles: No information available.
Bowel cleansing solutions (Polyethylene glycol, Macrogol) (Klean-Prep*, Moviprep*) P

**Formulations:** Oral: Powder for reconstitution.

**Action:** Bowel cleansing solutions contain polyethylene glycol as an osmotic laxative and balanced electrolytes to maintain isotonicity and prevent net fluid loss or gain. When administered orally they rapidly empty the bowel.

**Use:** Bowel preparation before colonoscopy or radiographic examination. May also be used for constipation. Powder may take several minutes to dissolve, and reconstitution is best performed by adding warm water to the powder.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** GI obstruction or perforation. Do not administer to heavily sedated patients or animals with a reduced gag reflex.

**Adverse reactions:** Diarrhoea is an expected outcome. Occasional vomiting is seen, especially if the maximum volume is administered. Inhalation can cause severe, and even fatal, aspiration pneumonia.

**Drug interactions:** Oral medication should not be taken within 1 hour of administration as it may be flushed from the GI tract and not absorbed.

**DOSES**

**Dogs:** Prior to lower GI examination: 22-33 ml/kg p.o. by stomach tube, two or three times, at least 4h apart.

**Cats:** Prior to lower GI examination: 22-33 ml/kg p.o. by naso-oesophageal tube.

**Small mammals, Birds, Reptiles:** No information available.

Brinzolamide (Azopt*) POM

**Formulations:** Ophthalmic: 10 mg/ml (1%) in 5 ml bottle.

**Action:** Reduces intraocular pressure by reducing the rate of aqueous humour production by inhibition of the formation of bicarbonate ions within the ciliary body epithelium.

**Use:** In the control of all types of canine glaucoma in dogs, either alone or in combination with other topicals. It may be better tolerated than dorzolamide due to a more physiological pH of 7.5. The concurrent use of a topical or systemic carbonic anhydrase inhibitor is not beneficial as there is no additional decrease in intraocular pressure compared with the sole use of either topical or systemic treatment. Brinzolamide is ineffective in normal cats; by contrast dorzolamide is effective in both dogs and cats.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Severe hepatic or renal impairment.

**Adverse reactions:** Local irritation. Brinzolamide may cause less ocular irritation than dorzolamide.

**Drug interactions:** No information available.
DOSES

**Dogs:** 1 drop per eye q8-12h.

**Cats:** Not applicable.

**Small mammals, Birds, Reptiles:** No information available.

---

**British anti-lewisite** see Dimercaprol

---

**Bromhexine** (Bisolvon) POM-V

**Formulations:** Injectable: 3 mg/ml solution. Oral: 10 mg/g powder.

**Action:** A bronchial secretolytic that disrupts the structure of acid mucopolysaccharide fibres in mucoid sputum and produces a less viscous mucus, which is easier to expectorate.

**Use:** To aid the management of respiratory diseases.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** No information available

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 3-15 mg/dog i.m. q12h; 2-2.5 mg/kg p.o. q12h.

**Cats:** 3 mg/cat i.m. q24h; 1 mg/kg p.o. q24h.

**Small mammals:** 0.3 mg/animal p.o. q24h.

**Birds:** 1.5 mg/kg i.m., p.o. q12-24h.

**Reptiles:** 0.1-0.2 mg/kg q24h.

---

**Bromocriptine** (Bromocriptine*, Parlodel*) POM

**Formulations:** Oral: 1 mg, 2.5 mg tablets; 5 mg, 10 mg capsules.

**Action:** Bromocriptine stimulates dopamine receptors in the CNS and inhibits release of prolactin by the pituitary.

**Use:** Management of false pregnancy.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Vomiting, anorexia, depression and behavioural changes may be seen.

**Drug interactions:** Metoclopramide may antagonize the hypoprolactinaemic effect of bromocriptine.

**DOSES**

**Dogs:** False pregnancy: 0.01 mg/kg p.o. q12h for 10 days or 0.03 mg/kg q24h for 16 days.

**Cats:** Not used.

**Small mammals, Birds, Reptiles:** No information available.
**Budesonide** (Budenofalk*, Budenofalk Rectal Foam*, Entocort*, Pulmicort*) POM

**Formulations:** Oral: 3 mg gastroresistant capsule, 3 mg capsule containing gastroresistant slow-release granules. Rectal: 2 mg (total dose) rectal foam, 0.02 mg/ml enema. Inhalant: 50 µg per metered inhalation.

**Action:** Anti-inflammatory and immunosuppressive steroid.

**Use:** A novel steroid generally given orally as enteric coated microspheres. It is metabolized approximately 90% on its first pass through the liver, and therefore is expected to have reduced systemic side effects. It is used in the treatment of idiopathic inflammatory bowel disease. There is little information on the use of this drug in dogs and even less in cats. Dosages have been extrapolated from human medicine, and the optimum dose is unknown. The uncoated powder for inhalant use should not be used for oral administration because of hydrolysis by gastric acid.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Intestinal perforation; severe hepatic impairment.

**Adverse reactions:** In theory, the rapid metabolism should give minimal systemic adverse effects. Signs of iatrogenic hyperadrenocorticism may develop. Hair loss, muscle wastage, elevation in liver enzymes, hepatomegaly, lethargy, polyphagia and polyuria/polydipsia have been noted at varying dosages. Adrenal suppression has been documented in dogs and iatrogenic hypocortisolaemia is a potential risk if budesonide is withdrawn rapidly following prolonged use. In theory sudden transfer from other steroid therapy might result in signs related to reductions in steroid levels.

**Drug interactions:** Additive effect if given with other corticosteroids.

**DOSES**

**Dogs:** Doses ranging from 0.05 to 0.99 mg/kg/day have been reported. The total dose should probably not exceed 3 mg p.o. q8h.

**Cats:** Total dose should probably not exceed 1 mg p.o. q8h.

**Small mammals, Birds, Reptiles:** No information available.

**Bupivacaine** (Marcain*, Sensorcaine*) POM

**Formulations:** Injectable: 2.5, 5.0, 7.5 mg/ml solutions, 2.5, 5.0 mg/ml solution with 1:200,000 adrenaline.

**Action:** Reversible blockade of the Na⁺ channel in nerve fibres produces local anaesthesia.

**Use:** Provision of analgesia by perineural nerve blocks, regional and extradural techniques. Onset of action is significantly slower than lidocaine (20-30 min for extradural analgesia) but duration of action is relatively prolonged (6-8 h). Lower doses should be used when systemic absorption is likely to be high (e.g. intrapleural analgesia). Small volumes of bupivacaine can be diluted with normal saline to enable wider distribution of the drug for perineural blockade.
Safety and handling: Normal precautions should be observed.

Contraindications: Do not give i.v. or use for i.v. regional anaesthesia. Use of bupivacaine with adrenaline is not recommended when local vasoconstriction is undesirable (e.g. end arterial sites) or when a significant degree of systemic absorption is likely.

Adverse reactions: Inadvertent intravascular injection may precipitate severe cardiac arrhythmias that are refractory to treatment.

Drug interactions: All local anaesthetics share similar side effects, therefore the dose of bupivacaine should be reduced when used in combination with other local anaesthetics.

DOSES

**Dogs:** Perineural: 1-2 ml of a 0.5 % solution. Extradural: 1.6 mg/kg (analgesia to level of L4), 2.3 mg/kg (analgesia to level of T11-T13); 1 mg/kg bupivacaine combined with preservative-free morphine 0.1 mg/kg. Interpleural: 1 mg/kg diluted with normal saline to a total volume of 10-20 ml. The solution can be instilled via a thoracotomy tube. Dilution reduces pain on injection due to the acidity of bupivacaine.

Systemic toxicity is avoided by using no more than 1-2 mg/kg q8h.

**Cats:** Doses as for dogs. Accurate dosing in cats is essential to prevent overdose.

**Small mammals:** No information available.

**Birds:** <2 mg/kg – local infusion; may mix with dimethylsulfoxide (DMSO) for topical application preoperatively in bumblefoot.

**Reptiles:** No information available.

**Buprenorphine** (Vetregesic) POM-V CD Schedule 3

Formulations: Injectable: 0.3 mg/ml solution.

Action: Analgesia through high affinity, low intrinsic activity and slow dissociation with the OP3 receptor.

Use: Relief of mild to moderate perioperative pain. As a partial agonist it antagonizes the effects of full opioid agonists (e.g. morphine, fentanyl). May be mixed with acepromazine to provide neuroleptanalgesia and sedation for minor procedures or preanaesthetic medication. Response to all opioids is variable between individuals; therefore assessment of pain after administration is imperative. Onset of action of buprenorphine is slower than morphine (15-30 min). Duration of effect is approximately 6 hours in cats and is likely to be similar in dogs. Higher doses of full OP3 agonists may be needed to provide additional analgesia after buprenorphine but these can be given immediately. Buprenorphine is metabolized in the liver, some prolongation of effect may be seen with impaired liver function. Buprenorphine crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Be careful of species differences in effect in birds. See Appendix for sedative protocols.
Safety and handling: Normal precautions should be observed.

Contraindications: Combination with full OP3 agonists is not recommended for analgesia; therefore, do not use for premedication when administration of potent opioids during surgery is anticipated.

Adverse reactions: As a partial agonist, side effects are rare after clinical doses.

Drug interactions: In common with other opioids, buprenorphine will reduce the doses of other drugs required for induction and maintenance of anaesthesia.

DOSES

Dogs: 20 µg/kg i.v., i.m., s.c. q6h.

Cats: Doses as for dogs. Also well tolerated and effective when given sublingually.

Small mammals: Ferrets: 0.05 mg/kg s.c. q6-12h; Rabbits: 0.05-0.1 mg/kg i.m., s.c. q6-12h; Guinea pigs, Gerbils, Hamsters, Rats: 0.01-0.05 mg/kg i.m., s.c. q6-12h; Mice: 0.05-0.1 mg/kg i.m., s.c. q6-12h.

Birds: 0.01-0.05 mg/kg i.v., i.m. q8-12h.

Reptiles: 0.01 mg/kg i.m. q24-48h.

Buserelin (Receptal) POM-V

Formulations: Injectable: 4 µg/ml solution.

Action: Synthetic GnRH (gonadotropin releasing hormone) analogue that stimulates LH and FSH production, thus causing oestrus to develop and progress.

Use: To supplement natural LH in cases of ovulation failure or delay. Will also induce lactation postpartum. In males, it may stimulate testosterone secretion and is indicated in the management of genital hypoplasia and reduced libido. In ferrets it may be used in the management of signs of oestrus. In rabbits it is used to induce ovulation postpartum for insemination and to improve conception rates. Used in birds for chronic egg laying (must be combined with husbandry changes).

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Anaphylactic reactions may occasionally occur.

Drug interactions: No information available.

DOSES

Dogs: 4 µg/dog i.m. q24-48h.

Cats: 2 µg/cat i.m. once.

Small mammals: Ferrets: 1.5 µg/ferret i.m. q24h for 2 days; Rabbits: 0.8 µg/rabbit s.c. at time of insemination or mating; Guinea pigs: 25 µg/guinea pig, repeat in 2 weeks.

Birds: 0.5-1.0 µg/kg q48h, up to 3 times.

Reptiles: No information available.
**Buspirone** (Buspar*, Buspirone Hydrochloride*) POM

**Formulations:** Oral: 5 mg, 10 mg tablets.

**Action:** Blocks presynaptic and partially postsynaptic serotonin 1A receptors and downregulates serotonin 2 receptors. It is metabolized to a pharmacologically active metabolite.

**Use:** Management of mild to moderate anxiety-related behaviour problems, including urine spraying in cats when associated with mild anxiety. Repeat dosing results in an exponential increase in blood levels, so caution is required in its use. It is suggested that it has less sedative effect than benzodiazepines and less anticholinergic effect than the tricyclic antidepressants. Cats may often become more affectionate upon medication, but caution is advised if buspirone is to be used in multi-cat households due to reports of paradoxical increases in intraspecific aggression in association with buspirone medication.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Renal or hepatic compromise, history of seizures.

**Adverse reactions:** Paradoxical increase in anxiety may occur in some cases.

**Drug interactions:** Plasma levels are elevated in the presence of erythromycin.

**DOSES**

**Dogs:** 1-2 mg/kg p.o. q8-12h.

**Cats:** 0.5-1.0 mg/kg p.o. q8-12h. Urine spraying: dose for an initial 2-week period, then evaluate response.

**Small mammals:** Rabbits: 0.25-1.0 mg/kg q12h p.o.

**Birds, Reptiles:** No information available.

**Busulfan** (Busulphan) (Myleran*) POM

**Formulations:** Oral: 2 mg tablet. (Available in other countries as Busulfex, 6 mg/ml solution for i.v. administration, but use not been reported in animals.)

**Action:** Interacts with cellular thio groups and nucleic acid to form DNA-DNA and DNA-protein crosslinks, resulting in inhibition of DNA synthesis and function.

**Use:** Management of chronic granulocytic leukaemia and polycythaemia vera. See Appendix for conversion of body weight to body surface area.

**Safety and handling:** Busulfan is listed as a Group 1 carcinogen. Disposable gloves should be worn to handle or administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.
**Contraindications:** Bone marrow suppression, animals at high risk of infection.

**Adverse reactions:** Frequent haematological assessment is required as excessive myelosuppression may result in irreversible bone marrow aplasia. Hyperpigmentation of the skin, progressive pulmonary fibrosis and hepatotoxicity may occur.

**Drug interactions:** Phenytoin increases busulfan metabolism in the liver.

**DOSES**

* **Dogs, Cats:** 2-6 mg/m² p.o. q24h initially until remission achieved, then at a reduced dosage/frequency as required to maintain remission.

* **Small mammals, Birds, Reptiles:** No information available.

---

**Butorphanol** (Dolorex, Torbugesic, Torbutrol) POM-V

**Formulations:** Injectable: 10 mg/ml solution. Oral: 5 mg, 10 mg tablets.

**Action:** Analgesia resulting from affinity for the OP2 opioid receptor. Also has OP3 receptor antagonist properties and an antitussive action resulting from central depression of the cough mechanism.

**Use:** Management of mild perioperative pain. Provision of sedation through combination with acepromazine or alpha-2 agonists. Potent antitussive agent indicated for the relief of acute or chronic non-productive cough associated with tracheobronchitis, tracheitis, tonsillitis or laryngitis resulting from inflammatory conditions of the upper respiratory tract. Butorphanol has a very rapid and relatively short duration of action; in different models analgesia has been shown to last between 45 minutes and 4 hours. Butorphanol is metabolized in the liver and some prolongation of effect may be seen with impaired liver function. Butorphanol crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Butorphanol is unlikely to be adequate for the management of severe pain. Higher doses of full OP3 agonists may be needed to provide additional analgesia after butorphanol but it is not necessary to wait 4h after butorphanol administration to give other opioids. Response to all opioids appears to be very variable between individuals; therefore assessment of pain after administration is imperative. Be careful of species differences in effect in birds. See Appendix for sedation protocols.

**Safety and handling:** Protect from light

**Contraindications:** Animals with diseases of the lower respiratory tract associated with copious mucus production. Premedication when administration of potent opioids during surgery is anticipated.

**Adverse reactions:** As an OP2 agonist/OP3 antagonist, side effects such as respiratory depression, bradycardia and vomiting are rare after clinical doses. Cough suppression following torbugesic tablets may be associated with mild sedation.
Drug interactions: In common with other opioids, butorphanol will reduce the doses of other drugs required for induction and maintenance of anaesthesia. Combination with full OP3 agonists is not recommended for analgesia, addition of butorphanol will reduce analgesia produced from the full OP3.

DOSES

Dogs:

• Analgesia: 0.2-0.5 mg/kg i.m., s.c.
• Sedation: 0.1-0.2 mg/kg i.m., s.c.
• Antitussive: 0.05-0.1 mg/kg i.m., s.c., 0.5-1 mg/kg p.o q6-12h.

Cats: 0.2-0.5 mg/kg i.m., s.c.

Small mammals:

- Ferrets: 0.25-0.4 mg/kg s.c. q4-6h (use with xylazine for sedation);
- Rabbits: 0.1-0.5 mg/kg s.c q4h (can use with medetomidine and ketamine for sedation and anaesthesia);
- Chinchilla: 0.5-2 mg/kg s.c. q4h;
- Guinea pigs: 0.2-2 mg/kg s.c. q4h;
- Gerbils, Hamsters, Rats, Mice: 1-5 mg/kg s.c. q4h.

Birds: 0.3-4 mg/kg i.m., i.v. q6-12h.

Reptiles:

• Analgesia: 0.5-1 mg/kg i.m.
• Pre-anaesthetic sedation: 0.4 mg/kg butorphanol + 2 mg/kg midazolam.
• Light anaesthesia: 0.5-1 mg/kg butorphanol + 10-30 mg/kg ketamine.

Butylscopolamine (Hyoscine) (Buscopan) POM-V, P

Formulations: Injectable: 4 mg/ml butylscopolamine + 500 mg/ml metamizole in 100 ml multi-dose bottle (Buscopan Compositum);
20 mg/ml butylscopolamine only, in 2 ml ampoules. Oral: 10 mg tablet containing butylscopolamine only.

Action: Inhibits M1 muscarinic acetylcholine receptors in the GI and urinary tracts causing smooth muscle relaxation but does not cross blood-brain barrier.

Use: Control of diarrhoea in dogs, particularly when pain or abdominal discomfort is present. Control of pain associated with urinary obstruction in dogs. Should be used in combination with investigations into the cause of abdominal pain or definitive relief of urinary obstruction.

Safety and handling: Avoid self-injection: metamizole can cause reversible but potentially serious agranulocytosis and skin allergies. Protect solution from light.

Contraindications: Intestinal obstruction.

Adverse reactions: Dry mouth, blurred vision, hesitant micturition and constipation at doses acting as gut neuromuscular relaxants. The i.m. route may cause a local reaction. See also Metamizole.
Drug interactions: Metamizole should not be given to dogs that have been treated with a phenothiazine, as hypothermia may result. Effects may be potentiated by concurrent use of other anticholinergic or analgesic drugs.

DOSES

**Dogs:** 0.1 ml/kg i.v., i.m. q12h; 0.5 mg/kg i.m., p.o. q12h.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

---

**Cabergoline** (Galastop) POM-V

**Formulations:** Oral: 50 µg/ml solution.

**Action:** Potent selective inhibition of prolactin.

**Use:** Control of false pregnancy in the bitch and galactostasis in lactating bitches. May have beneficial effect in birds with chronic egg laying and other hormonal disorders when combined with management changes.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in pregnant bitches as it may cause abortion. Should not be used in combination with hypotensive drugs or in animals in a hypotensive state.

**Adverse reactions:** Vomiting or anorexia may occur after the first one or two doses in a small proportion of cases; there is no need to discontinue treatment unless vomiting is severe or it persists beyond the second dose. In some animals a degree of drowsiness may be seen in the first 2 days of dosing. May induce transient hypotension.

**Drug interactions:** Metoclopramide antagonizes the hypoprolactinaemic effects.

**DOSES**

**Dogs:** 5 µg/kg p.o. q24h for 4-6 days. Control of aggression-related signs may require dosing for 2 weeks.

**Birds:** 10-50 µg/kg p.o. q24h.

**Cats, Small mammals, Reptiles:** No information available.

---

**CaEDTA** see Edetate calcium disodium

**Calcium salts** (Calcium borogluconate, Calcium gluconate, Calcium chloride) (Many cattle preparations, e.g. Calcibor. Minor component of Aquapharm No.9 and No.11. Several generic formulations.) POM-V

**Formulations:** There are many formulations available; this is a selection:
• Injectable: 200 mg/ml calcium borogluconate solution equivalent to 15 mg/ml calcium formed from 168 mg/ml of calcium gluconate and 34 mg/ml boric acid (Calcibor 20); 100 mg/ml (10%) calcium chloride solution containing 27.3 mg/ml elemental calcium (= 1.36 mEq calcium/ml = 680 µmol/ml); 100 mg/ml calcium gluconate solution 10 ml ampoules containing 9 mg elemental calcium/ml (= mEq calcium/ml).

• Oral: 600 mg calcium gluconate tablets (= 53.4 mg elemental calcium).

Note on other formulations: 11.2 mg calcium gluconate, 13.3 mg calcium borogluconate, 3.6 mg calcium chloride; each contains 1 mg elemental calcium = 0.5 mEq calcium.

**Action:** Calcium is an essential element involved in maintenance of numerous homeostatic roles and key reactions including activation of key enzymes, cell membrane potentials and nerve and musculoskeletal function.

**Use:** Management of hypocalcaemia. Calcium gluconate and borogluconate are preferred for this. Calcium chloride is used as a positive inotrope in the management of cardiac arrest. Serum calcium levels and renal function tests should be assessed before starting therapy. ECG monitoring during i.v. infusions is advised. Avoid using mixed electrolyte solutions intended for cattle use if possible.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Ventricular fibrillation or hypercalcaemia. Parenteral calcium should be used very cautiously in patients receiving digitalis glycosides or those with cardiac or renal disease. Calcium should be avoided in pregnancy unless there is a deficient state.

**Adverse reactions:** Hypercalcaemia can occur, especially in renal impairment or cardiac disease. Tissue irritation is common and can occur with injectable preparation regardless of route. Rapid injection may cause hypotension, cardiac arrhythmias and cardiac arrest. Perivascular administration is treated by stopping the infusion, infiltrating the tissue with normal saline and topical application of corticosteroids. Use i.v. in dehydrated reptiles and birds may precipitate gout.

**Drug interactions:** Patients on digitalis glycosides are more prone to develop arrhythmias if given i.v. calcium. All calcium salts may antagonize verapamil and other calcium-channel blockers.

Calcium borogluconate is compatible with most i.v. fluids except those containing other divalent cations or phosphorus. Calcium borogluconate is reportedly compatible with lidocaine, adrenaline and hydrocortisone. Calcium chloride is incompatible with amphotericin B, cephalothin sodium and chlorphenamine. Calcium gluconate is incompatible with many drugs, including lipid emulsions, propofol, amphotericin B, cefamandole, naftate, cephalothin sodium, dobutamine, methyprednisolone sodium succinate and metoclopramide. Consult manufacturers’ data sheets for incompatibilities with other solutions.
DOSES

**Dogs:**

- Hypocalcaemia: 50-150 mg/kg calcium (boro)gluconate = 0.5-1.5 ml/kg of a 10% solution i.v. over 20-30 min (equivalent to 3.8-11.4 mg/kg calcium borogluconate or 4.5-14 mg/kg calcium gluconate). Alternatively 5-10 mg/kg calcium chloride or 0.05-0.1 ml/kg of a 10% solution i.v. (equivalent to 0.068-0.136 mEq/kg). Additional doses to a maximum of 1-1.5 g/kg calcium boro(gluconate) may need to be administered i.v. over the next 24 hours. Adjust dose by monitoring serum calcium and phosphorus levels.

- Oral treatment of hypocalcaemia: 50-250 mg/kg calcium gluconate p.o. q8h; adjust dose by monitoring serum calcium and phosphorus levels.

- Cardiac arrest: 1-2 ml of a 10% calcium chloride solution i.v. to effect; monitor the ECG.

- Hyperkalaemia and hyperkalaemic cardiotoxicity: 0.5-1.5 ml/kg of a 10% solution of calcium gluconate i.v. slowly over 10-20 min, once. Monitor ECG. Rapidly corrects arrhythmias but effects are short-lived (5-10 min to effect) and i.v. glucose 0.5-1 g/kg with or without insulin may be needed.

**Cats:** Parenteral: 95-140 mg calcium gluconate/kg slowly i.v. to effect. Using 10% calcium gluconate this is equivalent to 1-1.5 ml/kg slowly i.v. over 10-20 min. Monitor ECG if possible. If bradycardia, or Q-T interval shortening occurs, slow rate or temporarily discontinue. Once life-threatening signs are resolved, add calcium gluconate to i.v. fluids and administer slowly at 60-90 mg/kg/day elemental calcium. This converts to 2.5 ml/kg of 10% calcium gluconate q6-8h or the equivalent as a constant rate infusion over 24h. Monitor serum calcium and adjust as needed. Oral: Begin oral therapy at 50-100 mg elemental calcium/kg/day divided in 3-4 doses, equivalent to 560-1120 mg oral calcium gluconate.

**Small mammals:** Chinchillas, Guinea pigs: 100 mg/kg i.m., i.p.

**Birds:** Egg retention, hypocalcaemia: 150-200 mg/kg calcium borogluconate i.m., s.c.; Hypocalcaemia: 5-10 mg/kg calcium gluconate i.m. q12h.

**Reptiles:** Egg retention, hypocalcaemia: 100 mg/kg calcium borogluconate i.v., i.m. s.c. or 50-100 mg/kg calcium gluconate mg/kg i.m., s.c. Use with oxytocin for egg retention. Dilute both 1 in 10 with water for injection or dextrose-saline before use.

**Carbamazepine** (Epimaz*, Tegretol*) POM

**Formulations:** Oral: 100 mg, 200 mg tablets, 20 mg/ml liquid. Slow release formulations for oral use also available.

**Action:** Stabilizes sodium ion channels in their inactive state, reducing the capacity to generate an action potential within the neurons.
**Carbimazole** (Vidalta) POM-V

**Formulations:** Oral: 10 mg, 15 mg tablets.

**Action:** Carbimazole is metabolized to the active drug methimazole, which interferes with the synthesis of thyroid hormones.

**Use:** Control of thyroid hormone levels in cats with hyperthyroidism. Has also been used in canine hyperthyroidism. A new formulation authorized for use in cats has recently been released. There are no data on its use in dogs. The dose is therefore empirically derived by extrapolation from the formulation authorized for use in humans. Consult specialist advice before administering to dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Vomiting, rashes, alopecia, jaundice, anorexia, lymphopenia and leucopenia are reported but are rarely seen. Animals that have an adverse reaction to methimazole are likely also to have an adverse reaction to carbimazole.

**Drug interactions:** Carbimazole must be discontinued for at least 2 weeks prior to iodine-131 treatment.

**DOSES**

**Dogs, Cats:** Starting dose 15 mg/animal p.o. q24h unless total thyroxine concentrations are <100 nmol/l in which case starting dose is 10 mg p.o. q24h. Adjust dose in 5 mg increments but do not break tablets.

**Small mammals, Birds, Reptiles:** No information available.
Carbomer 980 **(GelTears*, Liposic*, Viscotears*, Lubrithal*)** P

**Formulations:** Ophthalmic: 0.2% gel (10 g tube, single-use vial).

**Action:** Mucomimetic, replacing both aqueous and mucin components of the tear film.

**Use:** Tear replacement and beneficial for management of keratoconjunctivitis sicca (KCS or dry eye). It has longer corneal contact time than the aqueous tear substitutes.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** It is tolerated well and ocular irritation is unusual.

**Drug interactions:** No information available.

**DOSES**

*Dogs, Cats, Small mammals:* 1 drop per eye q4-6h.

*Birds, Reptiles:* No information available.

Carboplatin **(Carboplatin*, Paraplatin*)** POM

**Formulations:** Injectable: 10 mg/ml solution.

**Action:** Binds to DNA to form intra- and interstrand crosslinks and DNA-protein crosslinks. resulting in inhibition of DNA synthesis and function.

**Use:** Improves survival times when used as an adjunct to amputation in dogs with appendicular osteosarcoma and may have some efficacy in certain carcinomas. The drug is highly irritant and must be administered via a preplaced i.v. catheter. It is usually injected into the side port of a freely running i.v. infusion of 0.9% NaCl over a 10-15 min period. Do not use needles or i.v. sets containing aluminium as precipitation of the drug may occur. See Appendix for conversion of body weight to body surface area.

**Safety and handling:** Potent cytotoxic drug. Should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. Personnel must be protected with suitable clothing, gloves, mask and eye shield. In the event of contact with skin or eyes, the affected area should be washed with copious amounts of water or normal saline. Medical advice should be sought if the eyes are affected. Pregnant women should be excluded from handling cytotoxic agents. Staff and clients should be warned that urine (and saliva) may contain traces of the parent drug and should be handled with due care.

**Contraindications:** Use with caution in patients with abnormal renal function; dose reduction required.

**Adverse reactions:** Include myelosuppression, nephrotoxicity, nausea, vomiting, electrolyte abnormalities, neurotoxicity and anaphylactic reactions. However, compared to cisplatin, carboplatin shows reduced nephrotoxicity, neurotoxicity and emetogenicity.
Drug interactions: Concomitant use of aminoglycosides or other nephrotoxic agents may increase risk of nephrotoxicity.

DOSES

Dogs: 300 mg/m² i.v. q4wk.
Cats: 200 mg/m² i.v. q4wk.
Small mammals, Birds, Reptiles: No information available.

Carnidazole (Spartix*) AVM-GSL
Formulations: Oral: 10 mg tablet.
Action: Coccidiocidal; mode of action not known.
Use: Pigeon canker (Trichomonas columbae); treat all birds in loft simultaneously. It should be used in conjunction with good loft hygiene, including disinfection of feed and water bowls.
Safety and handling: Direct contact with the product must be avoided. Wear impermeable gloves when handling.
Contraindications: Not to be used in birds intended for human consumption.
Adverse reactions: No information available.
Drug interactions: None known.
DOSES

Birds: Pigeons: 12.5-25 mg p.o. once; Raptors: 25-30 mg/kg p.o., one dose normally sufficient but can be repeated next day if needed; Psittacids: 30-50 mg/kg p.o., repeat after 2 wk; Other birds: 20-30 mg/kg p.o. once.

Dogs, Cats, Small mammals, Reptiles: No information available.

Carprofen (Activyl, Carprogesic, Carprodyl, Rimadyl, Norocarp) POM-V
Formulations: Injectable: 50 mg/ml. Oral: 20 mg, 50 mg, 100 mg tablets (in plain and palatable formulations).
Action: Preferentially inhibits COX-2 enzyme, thereby limiting the production of prostaglandins involved in inflammation.
Use: Control of postoperative pain and inflammation following surgery and reduction of chronic inflammation, e.g. degenerative joint disease, osteoarthritis. In cats carprofen is only licensed as a single perioperative dose for the control of postoperative pain. Carprofen also has antipyretic effects. All NSAIDs should be administered cautiously in the perioperative period. Although carprofen preferentially inhibits COX-2, it may still adversely affect renal perfusion during periods of hypotension. If hypotension during anaesthesia is anticipated, delay carprofen administration until the animal is fully recovered from anaesthesia and normotensive. Liver disease will prolong the metabolism of carprofen, leading to the
potential for drug accumulation and overdose with repeated dosing. Prolonged long-term treatment should be under veterinary supervision. In cats, due to the longer half-life and narrower therapeutic index, particular care should be taken not to exceed the recommended dose and the use of a 1 ml graduated syringe is recommended to measure the dose accurately. Tablets are not authorized for use in cats.

**Safety and handling:** Rimadyl palatable tablets are extremely palatable. Animals have been reported to eat tablets spontaneously, resulting in overdose. Ensure that tablets are stored out of animal reach. Store injectable solution in the refrigerator; once broached the product is stable for use at temperatures up to 25°C for 28 days.

**Contraindications:** Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting abnormalities. Administration of carprofen to animals with renal disease must be carefully evaluated and is not advisable in the perioperative period. Do not give to pregnant animals or animals <6 weeks old. Use with caution in birds with dehydration, shock and renal dysfunction.

**Adverse reactions:** GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2 wk wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

**Drug interactions:** Different NSAIDs should not be administered within 24 hours of each other or glucocorticoids as they are more ulcerogenic when used concurrently. The nephrotoxic tendencies of all NSAIDs are significantly increased when administered concurrently with other nephrotoxic agents, e.g. aminoglycosides.

**DOSES**

**Dogs:** 4 mg/kg i.v., s.c. preoperatively or at time of anaesthetic induction; single dose should provide analgesia for up to 24h. Continued analgesia can be provided orally at 4 mg/kg/day, in single or divided dose. Subject to clinical response the dose MAY be reduced to 2 mg/kg/day, single dose, after 7 days. **Cats:** 4 mg/kg i.v., s.c., single dose preoperatively or at time of anaesthetic induction.

**Small mammals:** Ferrets: 1 mg/kg p.o; Rabbits: 1.5 mg/kg p.o., 1-2 mg/kg s.c., i.v. q24h; Rodents: 2-5 mg/kg total daily dose i.v., i.m., s.c., p.o., in single or two divided doses; Others: 4 mg/kg i.v., i.m., s.c.

**Birds:** 1-5 mg/kg i.m., s.c., p.o. q12-24h (higher rate appears effective for 24 hours).

**Reptiles:** 4 mg/kg s.c., i.m., p.o. once, then 2 mg/kg s.c., i.m., p.o. q24h.
Carvedilol (Cardevidol*, Eucardic*) POM

**Formulations:** Oral: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg tablets.

**Action:** Non-selective beta-blocker with the afterload reduction properties of an alpha-1 blocker. Additional antioxidant properties may decrease the oxidant stress associated with progressive heart failure.

**Use:** Adjunct to diuretics, ACE inhibitors and digoxin/pimobendan in management of symptomatic chronic heart failure whether due to valvular disease or DCM in dogs. Limited data on pharmacokinetics and pharmacodynamics in dogs. Treatment should not be started until congestive heart failure has been stabilized for at least 2 weeks initially.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Patients with supraventricular bradycardia, AV block and acute or decompensated heart failure.

**Adverse reactions:** Likely to be similar to those of propranolol, i.e. bradycardia, impaired AV conduction, myocardial depression, heart failure, syncope, bronchospasm, diarrhoea and peripheral vasoconstriction. A reduction in the glomerular filtration rate may exacerbate pre-existing renal impairment.

**Drug interactions:** Severe hypertension may develop when given with sympathomimetics (e.g. adrenaline, noradrenaline). Asystole, severe hypotension and heart failure develop in humans when given with verapamil. Enhanced hypotensive effects may develop when given with phenothiazines, nitroprusside, calcium-channel blockers and alpha-blockers. Hypotensive effect antagonized by NSAIDs. Carvedilol may enhance the hypoglycaemic effect of insulin. Systemic vascular resistance may develop when given with dobutamine. Increased risk of AV block and bradycardia when beta-blockers given with diltiazem or cardiac glycosides. Carvedilol increases plasma concentration of ciclosporin.

**DOSES**

**Dogs:** Start at 0.1-0.2 mg/kg q12h and gradually increase at 2-week intervals to target dose of 0.4 mg/kg p.o. q12h, if tolerated.

**Cats, Small mammals, Birds, Reptiles:** No information available.

CCNU see Lomustine

Cefalexin (Cephalexin) (Cefaseptin, Ceporex, Rilexine) POM-V

**Formulations:** Injectable: 180 mg/ml (18%) suspension. Oral: 50 mg, 75 mg, 120 mg, 250 mg, 300 mg, 500 mg, 600 mg tablets; granules which, when reconstituted, provide a 100 mg/ml oral syrup.
**Action:** Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, and affecting cell division. Resistant to some bacterial beta-lactamases, particularly those produced by staphylococci. As for other beta-lactam antibacterials, works in a time-dependent fashion.

**Use:** Active against several Gram-positive and Gram-negative organisms (e.g. *Staphylococcus*, *Pasteurella* and *Escherichia coli*). *Pseudomonas* and *Proteus* are often resistant. Maintaining levels above the MIC is critical for efficacy and prolonged dosage intervals or missed doses can compromise therapeutic response. Dose and dosing interval is determined by infection site, severity and organism. In severe or acute conditions, doses may be doubled or given at more frequent intervals.

**Safety and handling:** Reconstituted oral drops should be stored in the refrigerator and discarded after 10 days.

**Contraindications:** Patients hypersensitive to penicillins may also be sensitive to cephalosporins (cross-hypersensitivity in <10% of human patients); avoid use in animals with reported sensitivity to other beta-lactam antimicrobials.

**Adverse reactions:** Vomiting and diarrhoea most commonest; administration with food may reduce these. Cefalexin may cause enterotoxaemia in rodents and lagomorphs, although it is used in rabbits. Oral administration in particular carries a significant risk of fatal enterotoxaemia. Injection may be painful.

**Drug interactions:** Bactericidal activity may be affected by concomitant use of bacteriostatic agents (e.g. erythromycin, oxytetracycline). May be an increased risk of nephrotoxicity if cephalosporins are used with amphotericin or loop diuretics (e.g. furosemide); monitor renal function. Do not mix in the same syringe as aminoglycosides.

**DOSES**

**Dogs, Cats:** 10-25 mg/kg p.o. q8-12h; i.m, s.c q24h.

**Small mammals:** Ferrets: 15-30 mg/kg p.o. q8-12h; Rabbits: 15-20 mg/kg s.c q12-24h; Guinea pigs 25 mg/kg p.o., i.m. q12-24h; Others: 15-30 mg/kg i.m. q8-12h.

**Birds:** 35-100 mg/kg p.o., i.m. q6-8h.

**Reptiles:** 20-40 mg/kg p.o. q24h at 30°C.

**Cefotaxime** (Cefotaxime*, Claforan*) POM

**Formulations:** Injectable: 500 mg, 1 g, 2 g powders for reconstitution.

**Action:** Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, and affecting cell division. Resistant to many bacterial beta-lactamases, particularly those produced by staphylococci. As other beta-lactam antibacterials, works in a time-dependent fashion.
**Use:** Good activity against many Gram-negative organisms, especially Enterobacteriaceae (not *Pseudomonas*) but lower activity against many Gram-positive organisms than 1st and 2nd generation cephalosporins. It is important to maintain tissue concentrations above the MIC. Use should be reserved for patients with acute sepsis or serious infections where cultures are pending, other licensed preparations are not appropriate, and the animal is not a good candidate for intensive aminoglycoside therapy (e.g. pre-existing renal dysfunction).

**Safety and handling:** The reconstituted solution is stable for 10 days when refrigerated.

**Contraindications:** Patients hypersensitive to penicillins may also be sensitive to cephalosporins (cross-hypersensitivity in <10% of human patients); avoid use in animals with reported sensitivity to other beta-lactam antimicrobials. Use with care in patients with renal disease and consider increasing dose interval.

**Adverse reactions:** May produce pain on injection. GI disturbance and superinfection with resistant microorganisms is a potential risk.

**Drug interactions:** Bactericidal activity may be affected by concomitant use of bacteriostatic agents (e.g. oxytetracycline, erythromycin). The cephalosporins are synergistic with the aminoglycosides, but should not be mixed in the same syringe. May be increased risk of nephrotoxicity if cephalosporins are used with amphotericin or loop diuretics (e.g. furosemide); monitor renal function.

**DOSES**
- **Dogs, Cats:** 20-40 mg/kg i.v., i.m., s.c. q8-12h.
- **Small mammals:** No information available.
- **Birds:** 50-100 mg/kg i.m. q6-8h.
- **Reptiles:** 20-40 mg/kg i.m. q24h.

**Cefovecin** (Convenia) POM-V

**Formulations:** Injectable: Lyophilized powder which when reconstituted contains 80 mg/ml cefovecin.

**Action:** Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, and affecting cell division. Resistant to some bacterial beta-lactamases. Assumed to work in a time-dependent fashion as other Beta-lactam antibacterials.

**Use:** Specifically indicated for treatment of skin and soft tissue infections and for infections of the urinary tract. Good efficacy against organisms commonly associated with these conditions (e.g. *Staphylococcus intermedius*, *Streptococcus, Escherichia coli*, *Pasteurella multocida, Proteus*). Activity against anaerobes such as *Prevotella, Fusobacterium, Bacteroides* and *Clostridium* also appears
to be good. Not active against *Pseudomonas*. Due to unique pharmacokinetic profile, cefovecin has an extremely long half-life and only requires administration every 14 days.

**Safety and handling:** Store in the refrigerator even prior to reconstitution; use reconstituted drug within 28 days.

**Contraindications:** Do not use in small herbivores such as rabbits and guinea pigs. Do not use in cats and dogs <8 weeks old. Avoid use during lactation and in pregnant animals, as safety has not been established.

**Adverse reactions:** Cefovecin appears to be relatively safe but safety has not been assessed in renal disease. Reported adverse reactions include mild GI disturbance and transient swelling at the injection site.

**Drug interactions:** Cefovecin is highly bound to plasma proteins, therefore it would be prudent to exhibit caution when using in conjunction with other highly protein-bound drugs such as furosemide, NSAIDs and ketoconazole.

**DOSES**

*Dogs, Cats:* 8 mg/kg s.c., equivalent to 1 ml/10 kg of reconstituted drug subcutaneously. May be repeated after 14 days up to three times.

*Small mammals:* Do not use.

*Birds, Reptiles:* No information available.

---

**Ceftazidime** *(Fortum*, *Kefadim*) POM

**Formulations:** Injectable: 250 mg, 500 mg, 1 g, 2 g, 3 g powders for reconstitution.

**Action:** Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, and affecting cell division. Resistant to some bacterial beta-lactamases. As other beta-lactam antibacterials, works in a time-dependent fashion.

**Use:** Higher activity against many Gram-negative organisms but lower activity against many Gram-positives when compared to 1st and 2nd generation cephalosporins. Very good activity against *Pseudomonas* in humans. Use should be limited to cases with a confirmed susceptibility and acute sepsis or serious infections where licensed preparations are found to be inappropriate. Limited information on clinical pharmacokinetics in animal species and doses given below are empirical. Important to maintain tissue concentrations above the MIC with regular doses.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Patients hypersensitive to penicillins may also be sensitive to cephalosporins (cross-hypersensitivity in <10% of human patients); avoid use in animals with reported sensitivity to other beta-lactam antimicrobials.
Adverse reactions: GI disturbances associated with drug use in humans.

Drug interactions: Bactericidal activity may be affected by concomitant use of bacteriostatic agents (e.g. oxytetracycline, erythromycin). May be an increased risk of nephrotoxicity if cephalosporins are used with amphotericin or loop diuretics (e.g. furosemide); monitor renal function. Do not mix in the same syringe as aminoglycosides. Ceftazidime is synergistic with the aminoglycoside antimicrobials in vivo (often used in humans for pseudomonal infection in neutropenic patients).

DOSES

Dogs, Cats: 20-50 mg/kg i.v. q8-12h.
Small mammals: No information available.
Birds: Birds: 75-200 mg/kg i.v., i.m. q6-12h.
Reptiles: Most species: 20 mg/kg i.m., s.c., i.v. q72h; Chameleons: 20 mg/kg i.m., s.c. q24-48h.

Ceftiofur (Excenel) POM-V

Formulations: Injectable: 1 g, 4 g powder for reconstitution; 50 mg/ml suspension.
Action: Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity and affecting cell division. Resistant to many bacterial beta-lactamases, particularly those produced by staphylococci. Uniquely among the cephalosporins, ceftiofur is metabolized to desfuroylceftiofur which is an active metabolite. Action is time-dependent.

Use: Higher activity against many Gram-negative organisms, especially Enterobacteriaceae (not Pseudomonas) but lower activity against many Gram-positives than 1st and 2nd generation cephalosporins. Particularly useful for tortoises with bacterial respiratory tract infections (e.g. Pasteurella or Gram-negative bacteria). Use should be reserved for patients suffering from acute sepsis or serious infections where cultures are pending, other licensed preparations are not appropriate and the animal is not a good candidate for intensive aminoglycoside therapy (pre-existing renal dysfunction). Important to maintain tissue concentrations above the MIC. Authorized for use in dogs in other countries where the main indication for use is in the treatment of urinary tract infections.

Safety and handling: Store powder in the refrigerator; once reconstituted store in the refrigerator and discard after 24h.

Contraindications: Patients hypersensitive to penicillins may also be sensitive to cephalosporins (cross-hypersensitivity in <10% of human patients); avoid use in animals with reported sensitivity to other beta-lactam antimicrobials. Use with care in patients with renal disease and consider increasing dose interval.
**Adverse reactions:** May produce pain on injection. GI disturbance and superinfection with resistant microorganisms is a potential risk. May be an increased risk of nephrotoxicity if cephalosporins are used with amphotericin or loop diuretics (e.g. furosemide); monitor renal function. In dogs a dose- and duration-dependent anaemia and thrombocytopenia has been recorded, although this should not occur with recommended doses.

**Drug interactions:** Bactericidal activity may be affected by concomitant use of bacteriostatic agents (e.g. oxytetracycline, erythromycin). The cephalosporins are synergistic with the aminoglycosides, but should not be mixed in the same syringe.

**DOSES**

**Dogs:** 2.2 mg/kg s.c. q24h.

**Cats, Small mammals, Birds:** No information available.

**Reptiles:** Chelonians: 4 mg/kg i.m. q24h; Snakes: 2.2 mg/kg i.m. q24h.

---

**Cefuroxime** (Zinacef*, Zinnat*) POM

**Formulations:** Injectable: 250 mg, 750mg 1.5 g powders for reconstitution (sodium salt). Oral (as cefuroxime axetil): 125 mg, 250 mg tablets; 125 mg/5ml suspension.

**Action:** Binds to proteins involved in bacterial cell wall synthesis, thereby decreasing cell wall strength and rigidity, and affecting cell division. Resistant to some bacterial beta-lactamases. As other beta-lactam antibacterials, works in a time-dependent fashion. Cefuroxime axetil is hydrolysed in intestinal mucosa and liver to yield active drug giving oral bioavailability.

**Use:** Higher activity against many Gram-negative organisms but lower activity against many Gram-positive organisms when compared to 1st generation cephalosporins. Good activity against a wider spectrum of Enterobacteriaceae (not *Pseudomonas*). Many obligate anaerobes also susceptible. Many uses but may be particularly indicated for surgical prophylaxis in prolonged and difficult orthopaedic procedures. Important to maintain tissue concentrations above the MIC.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Patients hypersensitive to penicillins may also be sensitive to cephalosporins (cross-hypersensitivity in <10% of human patients); avoid use in animals with reported sensitivity to other beta-lactam antimicrobials.

**Adverse reactions:** May cause pain on i.m. and s.c. injection. GI disturbance has been reported in humans, particularly associated with the oral axetil formulation.

**Drug interactions:** Bactericidal activity may be affected by concomitant use of bacteriostatic agents (e.g. oxytetracycline, erythromycin). May be an increased risk of nephrotoxicity if
cephalosporins are used with amphotericin or loop diuretics (e.g. furosemide); monitor renal function. Synergistic with aminoglycosides, do not mix in the same syringe.

**DOSES**

**Dogs, Cats:** 10-15 mg/kg i.v. q8-12h.

**Small mammals:** No information available.

**Birds:** No information available.

**Reptiles:** 100 mg/kg i.m. q24h for 10 days at 30°C.

---

**Cephalexin** see **Cefalexin**

---

**Charcoal (Activated charcoal) (BCK, Actidose-Aqua*, Charcodote*, Liqui-Char*) AVM-GSL**

**Formulations:** Oral: granules containing 39.2 mg/g bismuth subnitrate + 49 mg/g calcium phosphate + 400 mg/g charcoal + 422 mg/g kaolin (BCK); 50 g activated charcoal powder or premixed slurry (200 mg/ml).

**Action:** Absorbs toxins, fluids and gases in the GI tract. Activated charcoal has increased porosity and enhanced absorptive capacity.

**Use:** Acute poisoning with organophosphates, carbamates, chlorinated hydrocarbons, strychnine, ethylene glycol, inorganic and organic arsenical and mercurial compounds, polycyclic organic compounds (most pesticides), and dermal toxicants that may be ingested following grooming. As a general rule administer at a dose of at least 10 times the volume of intoxicant ingested.

**Safety and handling:** Activated charcoal powder floats, covering everything in the area; prepare very carefully as it will stain permanently.

**Contraindications:** Activated charcoal should not be used prior to the use of emetics.

**Adverse reactions:** Charcoal colours stools black, which is medically insignificant but may be alarming to the owner.

**Drug interactions:** Activated charcoal reduces the absorption and therefore efficacy of orally administered drugs.

**DOSES**

**Dogs, Cats:** 0.5-4 g p.o. of activated charcoal/kg as a slurry in water by stomach tube; usually followed by a saline cathartic 20-30 min later. Repeat dosing prn if emesis or massive toxin ingestion occurs.

**Small mammals, Birds, Reptiles:** No information available.
**Chlorambucil** (Leukeran*) POM  
**Formulations:** Oral: 2 mg tablet.  
**Action:** Inhibits DNA synthesis and function, cell cycle non-specific  
**Use:** Management of lymphoproliferative, myeloproliferative and immune-mediated diseases. Immunosuppressive effect is not well defined and therefore it should only be considered where more established therapies such as prednisolone and azathioprine have failed. See Appendix for body weight to body surface area conversion tables.  
**Safety and handling:** Carcinogenic. Wear disposable gloves to handle/administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.  
**Contraindications:** Bone marrow suppression, factors predisposing to infection.  
**Adverse reactions:** Anorexia, nausea, vomiting, leucopenia, thrombocytopenia, anaemia (rarely), neurotoxicity (1 case reported in a cat).  
**Drug interactions:** Drugs that stimulate hepatic cytochrome P450 system increase cytotoxic effects. Prednisolone has a synergistic effect in the management of lymphoid neoplasia.  
**DOSES**  
**Dog, Cats:**  
- Chronic lymphocytic leukaemia: 2-6 mg/m² p.o. q24h initially until remission achieved, then at reduced dosage/frequency as required to maintain remission; or 0.2 mg/kg q24h for 7 days then 0.1 mg/kg q24h for maintenance. Often used with prednisolone 40 mg/m² p.o. q24h for 7 days then 20 mg/m² q48h.  
- Lymphoma: 15-20 mg/m² q2wk with prednisolone; or 1.4 mg/kg as single dose as substitute for cyclophosphamide in CHOP type protocols.  
- Immune-mediated disease: 1-2 mg/m² p.o. q24h.  
**Small mammals, Birds, Reptiles:** No information available.  

**Chloramphenicol** (Chloramphenicol*, Chloromycetin*, Kemicetine*) POM  
**Formulations:** Injectable: 1 g powder for reconstitution. Topical: Ophthalmic 1% ointment; 0.5% solution. Oral: 250 mg capsules.  
**Action:** Bacteriostatic antimicrobial that acts by binding to the 50S ribosomal subunit of susceptible bacteria, preventing bacterial protein synthesis.  
**Use:** Broad spectrum of activity against Gram-positive (e.g. *Streptococcus, Staphylococcus*), Gram-negative (e.g. *Brucella, Salmonella, Haemophilus*) and obligate anaerobic bacteria (e.g. *Clostridium, Bacteroides fragilis*). Other sensitive organisms include
Chlamydophila, Mycoplasma (unreliable in treatment of ocular mycoplasmosis) and Rickettsia. Resistant organisms include Nocardia and Mycobacterium. Acquired resistance may occur in Enterobacteriacea. High lipid solubility makes it suitable for the treatment of intraocular infections. It will also access the CNS. However, due to concerns of resistance development and human toxicity use should be restricted to individual animals where there is a specific indication such as salmonellosis resistant to other antimicrobials or deep infections of the eye. Patients with hepatic or renal dysfunction may need adjustment to dose. Decrease dose or increase dosing interval in neonates.

Safety and handling: Humans exposed to chloramphenicol may have an increased risk of developing a fatal aplastic anaemia. Products should be handled with care; use impervious gloves and avoid skin contact.

Contraindications: Use with caution or avoid in nursing bitches or queens, especially those with neonates, as crosses into milk.

Adverse reactions: Dose-related reversible bone marrow suppression can develop in all species. Unlike humans, the development of irreversible aplastic anaemia in veterinary species does not appear to be a significant problem. The cat, which has a reduced capacity to metabolize chloramphenicol, is more susceptible to bone marrow suppression and this is associated with both dose size and duration of therapy. Other adverse effects include nausea, vomiting diarrhoea and anaphylaxis.

Drug interactions: Irreversible inhibitor of a large number of hepatic cytochrome P450-dependent enzymes and so increases plasma levels of pentobarbital, phenobarbital and oral hypoglycaemic agents; recovery requires synthesis of new liver enzymes and can take up to 3 weeks. Rifampin accelerates the metabolism of chloramphenicol, thus decreasing serum levels. Chloramphenicol may inhibit activity of bactericidal antimicrobials such as the aminoglycosides and beta-lactams. May also be an inhibitory effect if used in combination with macrolide or lincosamide antimicrobials.

DOSES

**Dogs:** Ophthalmic: 1 drop q4-8h; ointment q8-12h. Systemic: 25-50 mg/kg i.v., i.m., s.c., p.o. q8-12h. CNS infections: 10-15 mg/kg p.o. q4-6h is recommended in some texts.

**Cats:** Ophthalmic: 1 drop q4-8h; ointment q8-12h. Systemic: 15-25 mg/kg slow i.v., i.m., s.c., p.o. q12h.

**Small mammals:** Ferrets: 25-50 mg/kg p.o., s.c., i.m., i.v., q12h; Rabbits: 50 mg/kg p.o. q12-24h; Mice: 50 mg/kg i.m., p.o. q12h, 200 mg/kg p.o. q12h or 0.5 mg/ml drinking water; Other rodents: 30-50 mg/kg i.v. i.m., s.c., p.o. q8-12h or, in drinking water, 1 mg/ml for Guinea pigs, 0.83 mg/ml for Gerbils.

**Birds:** 50 mg/kg i.v., i.m. q8h; 75 mg/kg p.o. q8h; Pigeons: 25 mg/kg p.o. q12h.

**Reptiles:** 40-50 mg/kg i.m., s.c., p.o. q24h.
Chlorhexidine (Savlon, Malaseb, Hibiscrub, Chlorohex*, Viatop*) POM-V, AVM-GSL

**Formulations:** Topical shampoo 2% chlorhexidine + 2% miconazole (Malaseb); Cleansing solution 1.5% chlorhexidine + cetrimide (Savlon); Surgical scrub solution 4% chlorhexidine + isopropyl alcohol (Hibiscrub); Chlorhexidine (0.12%) mouthwash (Chlorohex) Topical gel: 0.06% chlorhexidine, aqua, raffinose, propylene glycol, saponins, triethanolamine, acrylates, phenoxyethanol, benzoic acid esters, allantoin (Viatop).

**Action:** Chemical antiseptic that disrupts bacterial cell membrane.

**Use:** Topical treatment of bacterial, dermatophyte and Malassezia skin infections in dogs as a shampoo (Malaseb). Washing surgical instruments, routine antisepsis for surgical operations (Savlon, Hibiscrub). Dental hygiene (Chlorohex). Topical treatment of mild pruritus (Viatop). Concurrent systemic antibacterial therapy is generally advised when treating bacterial skin infections. Leave in contact with the skin for 5-10min prior to washing off. Chlorhexidine as a single agent is not consistently effective as an antifungal.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Ototoxic; should not be instilled in ears where the integrity of the tympanum is unknown.

**Adverse reactions:** May irritate mucous membranes.

**Drug interactions:** Not known.

**DOSES**

**Dogs, cats:** Shampoo 2-3 times weekly. May be used less frequently once infection is controlled.

**Small mammals:** Apply to affected area q8h at 0.5-2.0% concentrations. 0.05% solution in water can be used as a safe wound flush. When treating dermatophytosis continue treatment for 2 weeks after apparent clinical cure and negative fungal culture results. Otic: Dilute topical products to a 1.0% concentration and apply topically q8-12h.

**Birds, Reptiles:** No information available.

Chlorphenamine (Chlorpheniramine) (Piriton*) POM, GSL

**Formulations:** Injectable: 10 mg/ml solution. Oral: 4 mg tablet, 0.4 mg/ml syrup.

**Action:** Binds to H1 histamine receptors to prevent histamine binding.

**Use:** Management of allergic disease and early treatment of anaphylaxis. Specific doses for dogs and cats have not been determined by pharmokinetic studies.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction. May reduce seizure threshold.
Adverse reactions: May cause mild sedation.

Drug interactions: No information available.

DOSES

Dogs: 4-8 mg q8h.

Cats: 2-4 mg q8-12h.

Small mammals: Ferrets: 1-2 mg/kg p.o. q8-12h; Rodents: 0.6 mg/kg p.o. q24h.

Birds, Reptiles: No information available.

Chlorpheniramine see Chlorphenamine

Chlortetracycline (Aureomycin) POM-V

Formulations: Topical: 1% chlortetracycline hydrochloride ophthalmic ointment; wound powder containing 2% chlortetracycline hydrochloride (with 1% benzocaine); soluble powder 5.5% (w/w) for oral administration.

Action: Bacteriostatic antibiotic which inhibits bacterial protein synthesis.

Use: Inhibits growth of many Gram-positive and Gram-negative bacteria, rickettsiae, mycoplasmas, spirochaetes and other microbes. Used topically to treat ocular infections (including chlamydophilosis) and the wound powder is used topically to reduce infections. Also, soluble powder is used to make a solution suitable for oral administration (however, clean drinking water must also be available); because of the taste of the medication in the water this method is best avoided.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: No information available.

Drug interactions: Avoid combined use with bactericidal antimicrobials such as aminoglycosides and beta-lactams.

DOSES

Dogs, Cats: Ophthalmic: Apply at least three times daily to the affected eye. Use a separate tube for each animal to avoid contamination.

Small mammals: Chinchillas: 50 mg/kg p.o. q12h; Hamsters: 20 mg/kg p.o. q12h; Mice: 25 mg/kg p.o. q12h.

Birds: Pigeons: 40-50 mg/kg p.o. q8h or 130-400 mg/l drinking water; others: 2500-5000 mg per kg of feed for 45 days for chlamydophilosis.

Reptiles: No information available.
Cholestyramine see Colestyramine

Chorionic gonadotrophin (Human chorionic gonadotrophin, hCG) (Chorulon) POM-V

Formulations: Injectable: 1500 IU powder for reconstitution.

Action: In females induces follicular maturation, ovulation and development of the corpus luteum. In males stimulates testosterone secretion.

Use: Used to supplement or replace LH in cases of ovulation failure or delay, to induce lactation post-partum, or in bitches who fail to hold to mating. Used in ferrets to treat persistent oestrus. In male animals it may increase libido; may also assist the treatment of cryptorchidism before surgical castration, provided inguinal canal remains patent and therapy is started early.

Safety and handling: Reconstituted vials do not contain any preservative and so should be discarded within 24 hours.

Contraindications: No information available.

Adverse reactions: Anaphylactic reactions may occasionally occur.

Drug interactions: No information available.

DOSES

Dogs:

- Delayed ovulation: 22 IU/kg i.m. q24-48h or 44 IU/kg i.m. once; mate on behavioural oestrus.
- Anoestrus: 500 IU i.m. followed by 20 IU/kg q24h for 10 days.
- Deficient male libido, cryptorchidism: 100-500 IU i.m. twice weekly for up to 6 weeks.

Cats: Not authorized for use in cats. Doses as for dogs.

Small mammals: Ferrets: 100 IU s.c., i.m. once; use 10-14 days after onset of oestrus; Guinea pigs: 100 IU/kg weekly for 3 doses.

Birds, Reptiles: No information available.

Ciclosporin (Cyclosporin(e)) (Atopica, Neoral*, Optimmmune, Sandimmun*) POM

Formulations: Ophthalmic: 0.2% ointment (Optimmune). Oral: 10 mg, 25 mg, 50 mg, 100 mg capsules; 100 mg/ml solution. Injectable: 50 mg/ml solution.

Action: T lymphocyte inhibition.

Use: Authorized for veterinary use as topical ophthalmic preparation for keratoconjunctivitis sicca in dogs and as oral preparation for atopic dermatitis in dogs. May also be useful as an immunosuppressant in chronic superficial keratoconjunctivitis (pannus), perianal fistula, sebaceous adenitis and immune-mediated diseases. No evidence of systemic or ocular toxicity following ocular
administration but systemic absorption has been reported. Recommended that bacterial and fungal infections are treated before use. Whilst the nephrotoxicity seen in human patients does not appear to be common in dogs, care should be taken in treating dogs with renal impairment, and creatinine levels should be monitored regularly. Limited information on use in cats.

**Safety and handling:** Use gloves to prevent cutaneous absorption.

**Contraindications:** Not recommended in dogs up to 6 months old or <2 kg. Do not use in progressive malignant disorders. Do not give live vaccines during treatment or within a 2-week interval before or after treatment. Not recommended in diabetic dogs. In laboratory animals ciclosporin may affect circulating levels of insulin and cause increase in glycaemia; in the presence of suggestive signs of diabetes mellitus, the effect of treatment on glycaemia must be monitored. Use with caution in patients with pre-existing infections and monitor for opportunistic infections.

**Adverse reactions:** Immediate discomfort on topical application (blepharospasm) has been reported in dogs. Transient vomiting and diarrhoea may follow systemic administration; these are usually mild and do not require cessation of treatment. Infrequently observed adverse effects include: anorexia; mild to moderate gingival hyperplasia; verruciform lesions of the skin or change of hair coat; red and swollen pinnae; muscle weakness; and muscle cramps. These effects resolve spontaneously after treatment is stopped. Systemic treatment may be associated with an increased risk of malignancy.

**Drug interactions:** The metabolism of ciclosporin is reduced, and thus serum levels increased, by various drugs that competitively inhibit or induce enzymes involved in its metabolism, particularly cytochrome P450, including diltiazem, doxycycline and imidazole antifungal drugs. Ketoconazole at 5-10 mg/kg is known to increase the blood concentration of ciclosporin in dogs up to five-fold, which is considered to be clinically relevant. During concomitant use of ketoconazole and ciclosporin consider halving the dose or doubling the treatment interval if dog is on daily treatment. In humans is increased risk of nephrotoxicity if ciclosporin is administered with aminoglycosides, NSAIDs, quinolones, or trimethoprim/sulphonamides.; concomitant use of ciclosporin not recommended. Increased risk of hyperkalaemia if used with ACE inhibitors. As a substrate and inhibitor of the MDR 1 P-glycoprotein transporter, co-administration of ciclosporin with P-glycoprotein substrates such as macrocyclic lactones (e.g. ivermectin and milbemycin) could decrease the efflux of such drugs from blood-brain barrier cells, potentially resulting in signs of CNS toxicity.

**DOSES**

**Dogs:**
- Ocular disease: Apply approximately 0.5 cm of ointment to the affected eye q12h. It may take 2-4 weeks for improvement to occur (occasionally up to 12 weeks). Maintenance treatment should be continued with application q12h; in cases of excessive
• Tear production (>20 mm/minute), application can be reduced to q24h but only with caution and long-term, regular monitoring of tear production.

• Atopic dermatitis: 5 mg/kg p.o. q24h until signs controlled, then q48h as a maintenance dose.

• Perianal fistula, sebaceous adenitis: 5 mg/kg p.o. q12-24h.

• Immune-mediated disease: 5 mg/kg p.o. q12-24h.

**Cats:** 25 mg/cat q24h has been suggested for eosinophilic granuloma complex and 5 mg/kg/day for atopic dermatitis.

**Small mammals, Birds, Reptiles:** No information available.

---

**Cimetidine** (Zitac Vet for Dogs, Cimetidine*, Dyspamet*, Tagamet*) POM-V, POM

**Formulations:** Injectable: 100 mg/ml solution in 2 ml ampoule. Oral: 100 mg, 200 mg, 400 mg, 800 mg tablets; 40 mg/ml syrup.

**Action:** Histamine (H2) receptor antagonist, blocking histamine-induced gastric acid secretion. Rapidly absorbed with high bioavailability; undergoes hepatic metabolism and renal excretion. Plasma half-life is about an hour.

**Use:** Management of idiopathic, uraemic or drug-related erosive gastritis, gastric and duodenal ulcers, oesophagitis, and hypersecretory conditions secondary to gastrinoma mast cell neoplasia or short bowel syndrome. Efficacy against NSAID-induced ulcers is controversial. Reduction of vomiting due to gastritis and gastric ulceration is typically achieved in about 2 weeks but animals should be treated for at least 2 weeks after the remission of clinical signs, so minimum of 28 days recommended. If considered successful, medication can then be stopped. Rebound gastric acid secretion may be seen on cessation of cimetidine, so therapy should be tapered. A 2-week medication-free period should be allowed to see if vomiting occurs again. If the dog starts vomiting again after a medication-free period, treatment can be re-initiated, without risk for intolerance. Depending on the response, treatment can be adapted to the individual animal until the response is considered to be adequate and then continued at this level. Concomitant treatment with sucralfate may be helpful, and dietary measures should always be maintained. If used i.v., should be administered over 30 min to prevent cardiac arrhythmias and hypotension. Dosage should be reduced for animals with renal impairment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Rare, although hepatotoxicity and nephrotoxicity have been reported. Adverse reactions are generally minor even at high doses, but thrombocytopenia has been reported in dogs. In humans cimetidine has been associated with headache, gynaecomastia and decreased libido.
Drug interactions: Retards oxidative hepatic drug metabolism by binding to the microsomal cytochrome P450. May increase plasma levels of beta-blockers (e.g. propranolol), calcium-channel blockers (e.g. verapamil), diazepam, lidocaine, metronidazole, pethidine and theophylline. When used with other agents that cause leucopenia may exacerbate the problem. Sucralfate may decrease bioavailability; although there is little evidence to suggest this is of clinical importance it may be a wise precaution to administer sucralfate at least 2 hours before cimetidine. Stagger oral doses by 2 hours when used with other antacids, digoxin, ketoconazole or maropitant.

DOSES
Dogs: 5-10 mg/kg i.v., i.m., p.o. q8h.
Cats: 2.5-5 mg/kg i.v., i.m., p.o. q12h.
Small mammals: Ferrets: 5-10 mg/kg i.m., s.c., p.o. q8h; Rodents: 5-10 mg/kg p.o. s.c., i.m., i.v. q6-12h.
Birds: No information available.
Reptiles: 4 mg/kg i.m., p.o. q8h.

Cinchophen (PLT tablets) POM-V
Formulations: Oral: 200 mg tablets in combination with prednisolone 1 mg.
Action: Anti-inflammatory agent via non-steroidal action.
Use: Management of osteoarthritis pain in dogs. Animals should be monitored for signs of GI ulceration and deterioration in liver function. At the end of treatment the dose should be reduced gradually as with any glucocorticoid.
Safety and handling: Normal precautions should be observed.
Contraindications: Only commercially available in tablets combined with prednisolone, therefore do not administer to animals that are receiving therapy with other steroids or with NSAIDs. Do not give in perioperative period or to animals that are shocked, hypotensive or have renal insufficiency. Do not give to animals with hepatic disease or with pre-existing GI ulceration. Do not use in cats or small mammals.
Adverse reactions: GI ulceration and irritation are common side effects of all NSAIDs and particularly so with cinchophen. Advisable to stop therapy if diarrhoea or nausea persists beyond 1-2 days. Stop therapy immediately if GI bleeding suspected and begin symptomatic treatment. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease. Cinchophen has been associated with liver damage in dogs after prolonged oral administration (6 weeks).
Drug interactions: Increased risk of GI ulceration if administered concurrently or within 24 hours of other NSAIDs and glucocorticoids. Increased risk of nephrotoxicity if administered with other potentially nephrotoxic agents, e.g. aminoglycosides.
DOSES

**Dogs:** 25 mg/kg p/o q12h.

**Cats, Small mammals:** Do not use.

**Birds, Reptiles:** No information available.

---

**Ciprofloxacin** (Ciloxan*, Ciproxin*) POM

**Formulations:** Oral: 100 mg, 250 mg and 500 mg tablets; 50 mg/ml suspension.

Injectable: 2 mg/ml for i.v. infusion. Ophthalmic: 0.3% solution in 5 ml bottle; 0.3% ointment in 3.5 g tube.

**Action:** Bactericidal through inhibition of bacterial DNA gyrase.

**Use:** Broad-spectrum activity against wide range of Gram-negative and some Gram-positive aerobes; some activity against *Mycoplasma* and *Chlamydophila*. Active against many ocular pathogens, including *Staphylococcus* and *Pseudomonas aeruginosa*, although there is increasing resistance amongst staphylococci and streptococci. Use should be reserved for serious corneal infections due to sensitive organisms, particularly aminoglycoside-resistant *Pseudomonas*, when other antibacterials are ineffective, and should ideally be dictated by sensitivity testing. The eyedrop formulation is also used in reptiles for the topical management of wounds.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** May cause local irritation after application. In humans the following are reported: local burning and itching; lid margin crusting; hyperaemia; taste disturbances; corneal staining, keratitis, lid oedema, lacrimation, photophobia, corneal infiltrates; nausea; and visual disturbances.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 1 drop to affected eye q6h; loading dose can be used 1 drop to affected eye q15min for 4 doses.

**Small mammals:** Rabbits: 1 drop to affected eye q6h; loading dose can be used 1 drop to affected eye q15min for 4 doses; Chinchillas, Guinea pigs: 5-25 mg/kg p.o. q12h; Hamsters: 10-20 mg/kg p.o. q12h; Other rodents: 7-25 mg/kg p.o. q12h.

**Birds:** No information available.

**Reptiles:** Topical: 1 drop to affected eyes or in wounds. Systemic: 5-10 mg/kg p.o., s.c., i.m. q24h.

---

**Cisatracurium** (Nimbex*) POM

**Formulations:** Injectable: 2 mg/ml, 10 mg/ml solutions.
**Action:** Inhibits actions of acetylcholine at neuromuscular junction by binding competitively to nicotinic acetylcholine receptor on post-junctional membrane.

**Use:** Provision of neuromuscular blockade during anaesthesia. This may be to improve surgical access through muscle relaxation, to facilitate positive pressure ventilation or for intraocular surgery. Cisatracurium is one of the isomers that comprise atracurium; it is 3-5 times more potent than atracurium in dogs. This means that the plasma concentrations of the epileptogenic byproduct laudanosine are lower and there is less histamine release. Monitoring (using a nerve stimulator) and reversal of the neuromuscular blockade is recommended to ensure complete recovery before the end of anaesthesia. Hypothermia, acidosis and hypokalaemia will prolong the duration of action of neuromuscular blockade.

**Safety and handling:** Store in refrigerator.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available.

**Adverse reactions:** Can precipitate the release of histamine after rapid i.v. administration, resulting in bronchospasm and hypotension. Diluting the drug in normal saline and giving the drug slowly i.v. minimizes these effects.

**Drug interactions:** Neuromuscular blockade is more prolonged when given in combination with volatile anaesthetics, aminoglycosides, clindamycin and lincomycin.

**DOSES**

**Dogs:** 0.1 mg/kg i.v. followed by additional doses of 0.03 mg/kg as required (based on monitoring of neuromuscular blockade)

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Cisplatin** (Cisplatin*) POM

**Formulations:** Injectable: 1 mg/ml solution; 10 mg, 50 mg and 150 mg powders for reconstitution.

**Action:** Binds to DNA to form intra- and interstrand crosslinks and DNA-protein crosslinks, resulting in inhibition of DNA synthesis and function.

**Use:** Most commonly in management of canine osteosarcoma but has been described against various sarcomas and carcinomas. The drug is irritant and must be administered via a preplaced i.v. catheter. Do not use needles or i.v. sets containing aluminium; plastic catheters, plastic hub needles and stainless steel are compatible. Pre- and post-treatment hydration is important to ensure adequate renal clearance and reduce nephrotoxicity. Patients should be observed carefully during administration because of adverse effects. See Appendix for conversion of body weight to surface area.
Safety and handling: Cisplatin is sensitive to daylight but is not adversely affected by normal room lighting after dilution in 0.9% saline. Do not refrigerate, as cooling of diluted solutions can lead to precipitation. Potent cytotoxic drug that should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. The fluid bag containing cisplatin should be clearly labelled so that all personnel are aware of its contents. Personnel must be protected with suitable clothing, gloves, mask and eyeshield whenever the drug bottles, fluid bag, i.v. line or needle are handled. In the event of contact with skin or eyes, the affected area should be washed with copious amounts of water or normal saline. Medical advice should be sought if the eyes are affected. Pregnant women should be excluded from handling cytotoxic agents. If urine is collected a special license is required for its disposal. Cisplatin is excreted in urine for at least 24h.

Contraindications: Dogs with any evidence of renal dysfunction. Do not use in cats because of severe pulmonary reactions.

Adverse reactions: In the dog these include nephrotoxicity (major concern), myelosuppression, nausea, vomiting, electrolyte abnormalities, otoxicity, neurotoxicity, hyperuricaemia and anaphylactic reactions.

Drug interactions: Concomitant use of aminoglycosides may increase the risk of nephrotoxicity and ototoxicity. Plasma concentrations of cisplatin are reduced by anticonvulsant agents. Cisplatin acts as a radiosensitizing agent.

DOSES
Dogs: 50-70 mg/m² i.v. q3-4wk. Various protocols have been described (see relevant specialist texts):
Cats: Do not use.
Small mammals, Birds, Reptiles: No information available.

Clarithromycin (Klaricid*) POM

Formulations: Oral: 250 mg, 500 mg tablets; 125 mg/5 ml suspension; 250 mg/5 ml suspension; 250 mg granules sachet (to be dissolved in water). Injectable: 500 mg vial for reconstitution.

Action: Derived from erythromycin and with slightly greater activity. Bactericidal (time-dependent) or bacteriostatic properties, depending on concentration and susceptibility. Binds to the 50S ribosome, inhibiting peptide bond formation.

Use: Alternative to penicillin in penicillin-allergic humans as it has a similar, although not identical, antibacterial spectrum. Active against Gram-positive cocci (some staphylococci resistant), Gram-positive bacilli, some Gram-negative bacilli (e.g. Pasteurella) and some spirochaetes (e.g. Helicobacter). Some strains of Actinomyces, Nocardia, Chlamyphila and Rickettsia also inhibited. Most strains of
Enterobacteriaceae (*Pseudomonas, Escherichia coli, Klebsiella*) are resistant. Highly lipid-soluble and useful against intracellular pathogens. Particularly useful in management of respiratory tract infections, mild to moderate skin and soft tissue infections, and non-tubercular mycobacterial infections. For the latter used in combination with enrofloxacin and rifampin. Activity is enhanced in an alkaline pH; administer on an empty stomach. There is limited information regarding use in animals. Reduce dose in animals with renal impairment. In ferrets it has been used successfully to treat pneumonia due to *Mycobacterium abscessus* and it can be used in combination with omeprazole or ranitidine and bismuth or metronidazole for treatment of *Helicobacter mustelae*.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in animals with hepatic dysfunction. Reduce dose in animals with renal impairment.

**Adverse reactions:** In humans similar adverse effects to those of erythromycin are seen, i.e. vomiting, cholestatic hepatitis, stomatitis and glossitis.

**Drug interactions:** May increase serum levels of several drugs, including methylprednisolone, theophylline, omeprazole and itraconazole. The absorption of digoxin may be enhanced.

**DOSES**

**Dogs:** 4-12 mg/kg i.v. infusion, p.o. q12h. Doses of 15-25 mg/kg p.o. q8-12h are recommended in the treatment of leproid granuloma syndrome. These doses are empirical and are based on a very few reports.

**Cats:** 5-10 mg/kg i.v. infusion, p.o. q12h or 62.5 mg/cat p.o. These doses are empirical and are based on a very few reports.

**Small mammals:** Ferrets: 12.5 mg/kg p.o q8-12h for 14 days.

**Birds:** No information available.

**Reptiles:** 15 mg/kg p.o. q48-72h.

**Clazuril** (Appertex) AVM-GSL

**Formulations:** Oral: 2.5 mg tablet.

**Action:** Coccidiocidal; mode of action unclear.

**Use:** Treatment and control of coccidiosis (*Eimeria labbeana, E. columbarum*) in homing and show pigeons. Birds should be treated following transportation to shows or races where they may have been exposed to coccidia.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in birds intended for human consumption.

**Adverse reactions:** No information available.

**Drug interactions:** Do not administer with drugs that may cause vomiting.
DOSES

**Birds:** Raptors: 30 mg/kg once; Pigeons: 5-10 mg/kg once (treat all birds in loft simultaneously); Psittacines: 7 mg/kg p.o q2d for 2 doses.

**Dogs, Cats, Small mammals, Reptiles:** No information available.

**Clemastine** (Tavegil*) GSL

**Formulations:** Oral: 1 mg tablet.

**Action:** Binds to H1 histamine receptors and prevents histamine from binding.

**Use:** Management of allergic disease. Specific doses for cats have not been determined by pharmacokinetic studies and in dogs therapeutic levels are not usually achieved by oral administration.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction.

**Adverse reactions:** May cause mild sedation. May reduce seizure threshold.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 0.05-0.1mg/kg p.o. q12h.

**Cats:** 0.1 mg/kg p.o. q12h.

**Small mammals, Birds, Reptiles:** No information available.

**Clindamycin** (Antirobe, Clinacin) POM-V

**Formulations:** Oral: 25 mg, 75 mg, 150 mg, 300 mg capsules.

**Action:** Lincosamide antibiotic that binds to the 50S ribosomal subunit, inhibiting peptide bond formation. May be bactericidal or bacteriostatic depending on susceptibility.

**Use:** Bone and joint infections associated with Gram-positive bacteria; pyoderma; toxoplasmosis; and infections associated with the oral cavity. Active against Gram-positive cocci (including penicillin-resistant staphylococci), many obligate anaerobes, mycoplasmas and *Toxoplasma gondii*. Attains high concentrations in bone and bile. Being a weak base, it becomes ion-trapped (and therefore concentrated) in fluids that are more acidic than plasma, such as prostatic fluid, milk and intracellular fluid. There is complete cross resistance between lincomycin and clindamycin, and partial cross resistance with erythromycin. Use with care in individuals with hepatic or renal impairment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Lincosamides cause a potentially fatal clostridial enterotoxaemia in rabbits, guinea pigs, chinchillas and hamsters and should be avoided in these species.
Adverse reactions: Colitis, vomiting and diarrhoea are reported. Although not a major problem in dogs and cats, discontinue drug if diarrhoea develops. In cats may be associated with oesophagitis and oesophageal stricture; therefore consider following tablet administration with a small water or food bolus.

Drug interactions: May enhance the effect of non-depolarizing muscle relaxants (e.g. tubocurarine) and may antagonize the effects of neostigmine and pyridostigmine. Do not administer with macrolide, chloramphenicol or other lincosamide antimicrobials as these combinations are antagonistic.

DOSES

Dogs: 5.5 mg/kg p.o. q12h or 11 mg/kg q24h; in severe infection can increase to 11 mg/kg q12h. Toxoplasmosis: 25 mg/kg p.o. daily in divided doses.

Cats: 5.5 mg/kg p.o. q12h or 11 mg/kg q24h. Toxoplasmosis: 25 mg/kg p.o. daily in divided doses.

Small mammals: Ferrets: 5.5-11 mg/kg p.o. q12h (toxoplasmosis: 12.5-25 mg/kg p.o. q12h). Rabbits, Rodents: Do not use.

Birds: 25 mg/kg p.o. q8h or 50 mg/kg p.o. q12h or 100 mg/kg p.o. q24h.

Reptiles: 2.5-5 mg/kg p.o. q24h.

Clodronate (Bonefos*, Loron*) POM

Formulations: Injectable: 30 mg/ml, 60 mg/ml solutions. Oral: 400 mg capsule.

Action: Adsorbed on to hydroxyapatite crystals and ingested by osteoclasts. Metabolized in the cell to compounds that compete with ATP, leading to apoptosis of the cell and thus slowing the rate of bone destruction.

Use: Treatment of acute moderate to severe hypercalcaemia when other therapies are ineffective, or in the long-term therapy of chronic hypercalcaemia. Few reports of use in dogs and no reports of use in cats or other veterinary species. Excretion reduced in chronic renal failure; dose adjustment may be required.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Nausea, diarrhoea, hypocalcaemia, hypophosphataemia, hypomagnesaemia and hypersensitivity reactions.

Drug interactions: Reduced absorption if administered with antacids, calcium and iron salts; administer 2 hours apart. Concurrent use of aminoglycosides may result in severe hypocalcaemia.

DOSES

Dogs: 5-14 mg/kg i.v. q24h; 10-30 mg/kg p.o. q8-12h.

Cats, Small mammals, Birds, Reptiles: No information available.
**Clofazimine** (Clofazimine*) POM

**Formulations:** Oral: 100 mg capsule

**Action:** Not entirely clear but appears to be bactericidal and has membrane disrupting properties.

**Use:** Mycobacterial infections including feline leprosy. Limited information available, most derived from human medicine. For feline mycobacterial infection long-term treatment is required and combination therapy is utilized, e.g. with clarithromycin and doxycycline. Monitor hepatic and renal function during treatment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in hepatic and renal impairment.

**Adverse reactions:** In humans the major adverse effects are nausea, diarrhoea and renal and hepatic impairment (monitor functions during therapy). Skin discoloration has been reported in the cat.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 2-12 mg/kg p.o. q24h for 2-6 months.

**Small mammals, Birds, Reptiles:** No information available.

---

**Clomipramine** (Clomicalm) POM

**Formulations:** Oral: 5, 20, 80 mg tablets.

**Action:** Both clomipramine and its primary metabolite desmethylclomipramine are active in blocking serotonin and noradrenaline re-uptake in the brain, with resultant anxiolytic, antidepressant and compulsive effects.

**Use:** Licensed for use in association with a behaviour modification plan for the management of separation-related disorders in dogs. Also used in management of a wider range of anxiety-related disorders in dogs and cats, including ‘compulsive behaviours’, noise fears and urine spraying. Used in birds for feather plucking, especially if due to separation anxiety; should be used in association with a behaviour modification plan. Can be used with benzodiazepines.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Patients sensitive to tricyclic antidepressants. Not to be given in association with monoamine oxidase inhibitors (e.g. selegiline). Not recommended for use in male breeding animals, as testicular hypoplasia may occur. Care required before use in animals with a history of constipation, epilepsy, glaucoma, urinary retention or arrhythmias. Do not give with, or within 2 weeks of, monoamine oxidase inhibitors.

**Adverse reactions:** May cause sporadic vomiting, changes in appetite or lethargy. Vomiting may be reduced by co-administration with a small quantity of food.
Drug interactions: May potentiate the effects of the anti-arrhythmic drug quinidine, anticholinergic agents (e.g. atropine), other CNS active drugs (e.g. barbiturates, benzodiazepines, general anaesthetics, neuroleptics), sympathomimetics (e.g. adrenaline) and coumarin derivatives. Simultaneous administration with cimetidine may lead to increased plasma levels of clomipramine. Plasma levels of certain anti-epileptic drugs, e.g. phenytoin and carbamazepine, may be increased by coadministration with clomipramine.

DOSES

**Dogs:** 1-2 mg/kg p.o. q12h.

**Cats:** 0.25-1 mg/kg p.o. q24h.

**Small mammals:** No information available.

**Birds:** 0.5-1 mg/kg p.o. q6-8h.

**Reptiles:** No information available.

### Clonazepam

(Rivotril*) POM

**Formulations:** Oral: 500 µg, 2 mg tablets.

**Action:** Enhances activity of gamma-aminobutyric acid (GABA), the major inhibitory neurotransmitter in the brain, in a similar manner to diazepam.

**Use:** Management of muscular hypertonicity (episodic falling) in the Cavalier King Charles Spaniel. Care is required when withdrawing clonazepam after prolonged therapy and the dose should be tapered off.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Severe respiratory disease, marked muscle weakness.

**Adverse reactions:** Generally mild, with sedation and respiratory suppression at higher doses being the most important.

**Drug interactions:** Drugs that result in hepatic enzyme induction, e.g. phenobarbital and phenytoin, may accelerate its metabolism.

**DOSES**

**Dogs:** 0.5 mg/kg p.o. q8h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

### Clonidine

(Catapres*) POM

**Formulations:** Injectable: 150 mg/ml solution.

**Action:** Stimulates the secretion of growth hormone releasing hormone (GHRH) from the hypothalamus.

**Use:** To assess the pituitary’s ability to produce growth hormone (GH). The dose required to elicit a response has not been well established in dogs and not at all in other veterinary species. Specialist texts should be consulted if attempting a clonidine
stimulation test. Assessment of plasma insulin-like growth factor-1 (IGF-1) concentration in a single sample is a useful screening test for growth hormone disorders.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Due to effects on blood glucose, use in diabetic animals is not recommended.

**Adverse reactions:** Transient sedation and bradycardia may develop.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 3-10 µg/kg i.v. once.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Clopidogrel** (Plavix*) POM

**Formulations:** Oral: 75 mg tablets.

**Action:** By inhibiting binding of ADP to its receptor site on platelets, prevents activation of the glycoprotein IIb/IIIa receptor necessary for platelet aggregation.

**Use:** Prevention of thrombosis in cats with significant heart disease. May be used to prevent initial thrombosis or to reduce the risk of subsequent thrombosis after a previous thromboembolic event. There are few published data on the usage of this drug in animals to date. May be used in cats in conjunction with aspirin (as the drugs act on different parts of the platelet activation cycle). May be substituted for aspirin if aspirin is not tolerated.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Bleeding disorders, GI ulceration. Care if renal or hepatic impairment is present.

**Adverse reactions:** None reported to date. In humans skin reactions have been reported. Overdoses will be expected to lead to bleeding disorders.

**Drug interactions:** Not well known. Do not use with anticoagulants, e.g. warfarin.

**DOSES**

**Dogs:** No information available.

**Cats:** 18.75 mg/cat p.o. q24h.

**Small mammals, Birds, Reptiles:** No information available.

---

**Clotrimazole** (Canesten*, Clotrimazole*, Lotriderm*) POM

**Formulations:** Topical: 1% cream; 1% solution. Many other products available; some contain corticosteroids.
**Action:** Topical imidazole with an inhibitory action on the growth of pathogenic dermatophytes, *Aspergillus* and yeasts by inhibiting cytochrome P450-dependent ergosterol synthesis.

**Use:** Superficial fungal infections. Naso-sinal infections including aspergillosis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Otic: Instil 3-5 drops in ear q12h. Topical: Apply to affected area and massage in gently q12h; if no improvement in 4 weeks re-evaluate therapy or diagnosis. Nasal: Instil 10 g (dogs up to 10 kg) or 20 g (dogs >10 kg) of 1% cream in each frontal sinus via trephine holes. Alternatively, instil 30 ml (in dogs up to 10 kg) or 60 ml (in dogs >10 kg) of a 1% solution in polyethylene glycol into each nasal cavity, with nares and nasopharynx sealed by Foley catheters and turning every 15 min. A combination of both approaches may be used.

**Small mammals:** Rabbits: Otic: Instil 3-5 drops in ear q12h; Topical: Apply to affected area and massage in gently q12h; if no improvement in 4 weeks re-evaluate therapy or diagnosis.

**Birds:** Endoscopic: 10 mg/kg applied directly to fungal lesions. Nasal flush: 10 mg/ml (flush volume 20 ml/kg). Intratracheal: 2-3 ml of a 1% solution nebulized for periods of 1 hour q24h or topically.

**Reptiles:** Apply topically to lesion q12h.

---

**Cloxacillin (Orbenin) POM-V**

**Formulations:** Ophthalmic: Cloxacillin benzathine ester 16.7% suspension.

**Action:** Beta-lactamase-resistant penicillin which is bactericidal and works in a time-dependent fashion. Binds to penicillin-binding proteins involved in cell wall synthesis, thereby decreasing bacterial cell wall strength and rigidity, and affecting cell division, growth and septum formation.

**Use:** Narrow spectrum antimicrobial. Less active than penicillin G or V against *Streptococcus*. Specifically indicated for ocular infections by beta-lactamase-producing *Staphylococcus*. Avoid contamination of the tube during use.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer penicillins to hamsters, gerbils, guinea pigs, chinchillas or rabbits.

**Adverse reactions:** No information available.

**Drug interactions:** Avoid the concomitant use of bacteriostatic antibiotics (chloramphenicol, erythromycin, tetracycline).
DOSES

**Dog, Cats, Birds:** Apply 1/10th of a tube (0.3 g) q24h.

**Small mammals:** Rabbits, Chinchillas, Hamsters, Gerbils, Guinea pigs: do not use.

**Reptiles:** No information available.

---

**Co-danthrimer, Co-danthrusate** see Dantron

---

**Codeine** (Codeine*, Pardale-V) POM

**Formulations:** Oral: 3 mg/ml, 3 mg/5 ml linctus.

**Action:** Opioid analgesic.

**Use:** Cough suppression, analgesia and diarrhoea. Pardale-V is a veterinary formulation with 400 mg paracetamol + 9 mg codeine. However, to deliver the dose of codeine listed below would result in a very high dose of paracetamol and therefore Pardale-V tablets cannot be recommended as a source of codeine for general usage. Never administer Pardale-V to cats.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Renal insufficiency, hypoadrenocorticism, increased intracranial pressure, hypothyroidism.

**Adverse reactions:** Sedation, ataxia, respiratory depression and constipation.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 0.5-2 mg/kg p.o. q12h.

**Cats:** Do not use formulation with paracetamol.

**Small mammals, Birds, Reptiles:** No information available.

---

**Colchicine** (Colchicine*) POM

**Formulations:** Oral: 0.5 mg tablet.

**Action:** Colchicine inhibits collagen synthesis, may enhance collagenase activity and blocks the synthesis and secretion of serum amyloid A.

**Use:** Management of fibrotic hepatic and pulmonary diseases, oesophageal stricture and renal amyloidosis (including that caused by ‘Shar pei fever’). In birds, used for gout and hepatic cirrhosis/fibrosis. Only anecdotal evidence of efficacy against fibrosis in dogs. Prophylactic use in Shar pei fever cannot be recommended at this time.

**Safety and handling:** Protect from light.

**Contraindications:** Pregnancy.
Adverse reactions: The commoner adverse effects include vomiting, abdominal pain and diarrhoea. Rarely, renal damage, bone marrow suppression, myopathy and peripheral neuropathy may develop. Colchicine may cause elevated serum ALP and ALT, decreased platelet counts and false-positive results when testing urine for RBCs and haemoglobin. Overdoses can be fatal.

Drug interactions: Possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ciclosporin.

DOSES
Dogs: 0.03 mg/kg p.o. q8-72h in conjunction with appropriate specific/dietary therapy.
Cats, Small mammals: No information available.
Birds: 0.04 mg/kg q12h.
Reptiles: No information available.

Colestyramine (Cholestyramine) (Questran*) POM
Formulations: Oral: 4 g powder/sachet.
Action: Ion exchange resin.
Use: In rabbits for absorbing toxins produced in the GI tract following the development of overgrowth of Clostridium. In dogs for the reduction of serum cholesterol in idiopathic hypercholesterolaemia. May be used in digoxin overdose in dogs.
Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: Constipation may develop.
Drug interactions: Colestyramine reduces the absorption of digoxin, anticoagulants, diuretics and thyroxine.
DOSES
Dogs: 1-2 g/dog p.o. q12h.
Cats: No information available.
Small mammals: Rabbits: 2 g/rabbit p.o. syringed gently with 20 ml water.
Birds, Reptiles: No information available.

Cordycepic acid see Mannitol

Crisantaspase (Asparaginase, L-Asparginase) (Asparaginase*, Erwinase*, Elspar*) POM
Formulations: Injectable: vials of 10,000 IU powder for reconstitution.
**Action:** Lymphoid tumour cells are not able to synthesize asparagine and are dependent upon supply from the extracellular fluid. Crisantaspase deprives malignant cells of this amino acid, which results in cessation of protein synthesis and cell death.

**Use:** Main indication is treatment of lymphoproliferative disorders. See Appendix for conversion of body weight to surface area.

**Safety and handling:** Contact irritant, both as powder and in solution. Handle and administer with caution.

**Contraindications:** Patients with active pancreatitis or a history of pancreatitis.

**Adverse reactions:** Anaphylaxis may follow administration, particularly i.v. Premedication with an antihistamine is recommended before administration by i.m. route. Haemorrhagic pancreatitis has been reported in dogs.

**Drug interactions:** Administration with or before vincristine may reduce clearance of vincristine and increase toxicity; thus, if used in combination the vincristine should be given 12-24 hours before the enzyme.

**DOSES**

*Dogs, Cats:* 10,000-40,000 IU/m² i.m. q7d or less frequently.

*Small mammals, Birds, Reptiles:* No information available.

---

**Cyclopentolate** (Cyclopentolate hydrochloride*, Mydrilate*)

**POM**

**Formulations:** Ophthalmic: 0.5%, 1% (and single-use vials).

**Action:** Inhibits acetylcholine in the iris sphincter and ciliary body muscles, causing mydriasis (dilates pupil) and cycloplegia (paralysis of the ciliary muscle).

**Use:** Mainly used preoperatively for intraocular surgery to prevent intraoperative miosis. Its prolonged action (60 hours) prevents usefulness for intraocular examination, in contrast to tropicamide. Rarely used in veterinary medicine.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in glaucoma and lens luxation.

**Adverse reactions:** May cause salivation in cats, and chemosis in dogs.

**Drug interactions:** No information available.

**DOSES**

*Dogs, Cats, Small mammals:* 1 drop per eye.

*Birds, Reptiles:* No information available.
Cyclophosphamide (Cyclophosphamide*, Endoxana*) POM

Formulations: Injectable: 100 mg, 200 mg, 500 mg, 1000 mg powder for reconstitution. Oral: 50 mg (available in UK), 25 mg tablets (available in USA, trade name Cytoxan).

Action: Metabolites crosslink DNA resulting in inhibition of DNA synthesis and function.

Use: Treatment of lymphoproliferative diseases, myeloproliferative disease and immune-mediated diseases. May have a role in management of certain sarcomas and carcinomas.

Safety and handling: Potent cytotoxic drug and carcinogen. Intravenous preparations should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. Personnel must be protected with suitable clothing, gloves, mask and eyeshield. In the event of contact with skin or eyes, wash the affected area with copious amounts of water or normal saline. Seek medical advice if the eyes are affected. Pregnant women should not handle cytotoxic agents. Disposable gloves should be worn to handle and administer tablets. Warn staff and clients that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care. Do not split tablets. If necessary increase dose and decrease frequency, or consider alternative drugs or routes.

Contraindications: Use with caution in patients with renal failure; dose reduction may be required.

Adverse reactions: Myelosuppression, with the nadir usually occurring 7-14 days after the start of therapy; regular monitoring of WBCs recommended. A metabolite of cyclophosphamide (acrolein) may cause a sterile haemorrhagic cystitis, particularly following i.v. administration. The cystitis may be persistent. This risk may be reduced by increasing water consumption and ensuring adequate urine flow. Other effects include vomiting, diarrhoea, hepatotoxicity, nephrotoxicity and a reduction in hair growth rate.

Drug interactions: Increased risk of myelosuppression if thiazide diuretics are given concomitantly. Absorption of orally administered digoxin may be decreased by cyclophosphamide; this may occur several days after dosing. Barbiturates increase cyclophosphamide toxicity due to an increased rate of conversion to its metabolites. Phenothiazines, chloramphenicol and corticosteroids reduce cyclophosphamide efficacy. Cisplatin has a synergistic effect. If administered with doxorubicin there is an increased risk of cardiotoxicity. Insulin requirements are altered by concurrent cyclophosphamide therapy.

DOSES

Dogs:
- Lymphoid neoplasia: generally 50 mg/m² p.o. q48h or 4 consecutive days/week; or 200-250 mg/m² i.v. q3 weeks. See Chemotherapy protocols in Appendix.
• Immune-mediated disease: 50 mg/m² p.o. or 1.5 mg/kg p.o. (dogs >25 kg); 2 mg/kg p.o. (dogs 5-25 kg); 2.5 mg/kg p.o. (dogs <5 kg). Give for 4 consecutive days/week or q48h.

Cats:
• Lymphoid neoplasia: as for dogs, except 200-300 mg/m² in ‘high dose’ COP regimes.
• Immune-mediated disease: 2.5 mg/kg p.o. q24h (or equivalent).

Small mammals: Ferrets: Lymphoma: 10 mg/kg p.o., s.c. as part of chemotherapy protocols similar to those in cats and dogs.

Birds, Reptiles: No information available.

Cyclosporin(e) see Ciclosporin

Cyproheptadine (Periactin*) POM
Formulations: Oral: 4 mg tablet.
Action: Binds to and blocks the activation of H1 histamine and serotonin receptors.
Use: Management of allergic disease and appetite stimulation. Also used in cats with aortic thromboembolism as serotonin, along with other mediators, is involved in collateral vasoconstriction. Maintenance of this collateral supply is important in recovery. Specific doses for dogs and cats have not been determined by pharmokinetic studies and clinical effectiveness has not been established.
Safety and handling: Normal precautions should be observed.
Contraindications: Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction.
Adverse reactions: May cause mild sedation, polyphagia, weight gain. May reduce seizure threshold.
Drug interactions: No information available.
DOSES
Dogs, Cats: 0.1-0.5 mg/kg p.o. q8-12h.
Small mammals, Birds, Reptiles: No information available.

Cytarabine (Cytosine arabinoside, Ara-C) (Cytarabine*, Cytosar-U*) POM
Formulations: Injectable: 100 mg, 500 mg powders for reconstitution.
Action: The active nucleotide metabolite ara-CTP is incorporated into DNA and inhibits pyrimidine and DNA synthesis.
Use: Management of lymphoproliferative and myeloproliferative disorders. Use in treatment of meningoencephalitis has recently been reported. See Appendix for conversion of body weight to surface area.
Safety and handling: Protective clothing should be worn to handle or administer cytarabine. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care. After reconstitution, store at room temperature and discard after 48 hours or if a slight haze develops.

Contraindications: No information available.

Adverse reactions: Vomiting, diarrhoea, leucopenia. As it is a myelosuppressant, careful haematological monitoring is required.

Drug interactions: Oral absorption of digoxin is decreased. Activity of gentamicin may be antagonized. Simultaneous administration of methotrexate increases the effect of cytarabine.

DOSES

_Dogs, Cats:_ 100 mg/m$^2$ i.v. q24h for 4 days, or 100 mg/m$^2$ by i.v. infusion over 24h, or 20 mg/m$^2$ intrathecally q1-5d.

_Small mammals, Birds, Reptiles:_ No information available.

_Cytosine arabinoside_ see Cytarabine

**Dacarbazine** (Dacarbazine*, DTIC*, Imidazole Carboxamide*)

POM

Formulations: Injectable: 100 mg, 200 mg, 500 mg powders for reconstitution.

Action: Methylates nucleic acids and inhibits DNA, RNA and protein synthesis.

Use: Management of lymphoproliferative diseases, melanoma and soft tissue sarcomas. See Appendix for conversion of body weight to surface area.

Safety and handling: As with all cytotoxic agents, care is required when handling this drug. See specialist texts for further advice.

Contraindications: Bone marrow suppression.

Adverse reactions: May be severe. They include myelosuppression, intense nausea and vomiting.

Drug interactions: Phenobarbital increases the metabolic activation of dacarbazine.

DOSES

_Dogs, Cats:_ 200-250 mg/m$^2$ q24h on days 1-5. Repeat cycle every 21-28 days.

_Small mammals, Birds, Reptiles:_ No information available.
**Dactinomycin (Actinomycin-D)** *(Dactinomycin*, *Cosmegen*, *Lyovac*) POM

**Formulations:** Injectable: 0.5 mg powder for reconstitution.

**Action:** Inhibits DNA synthesis and function. Inhibition of RNA and protein synthesis may also contribute to cytotoxic effects.

**Use:** Has been used in rescue protocols for canine lymphoma. See Appendix for conversion of body weight to surface area.

**Safety and handling:** Dactinomycin should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. Personnel must be protected with suitable clothing, gloves, mask and eyeshield. In the event of contact with skin or eyes, the affected area should be washed with copious amounts of water or normal saline. Medical advice should be sought if the eyes are affected. Pregnant women should be excluded from handling cytotoxic agents. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

**Contraindications:** No information available.

**Adverse reactions:** Myelosuppression is the main dose-limiting toxicity. GI toxicity may also occur. The drug is vesicant and tissue damage will result from extravasation.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 0.5-0.75 mg/m² slow i.v. via a pre-placed catheter.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Danazol** *(Danazol*, *Danol*) POM

**Formulations:** Oral: 100 mg, 200 mg capsules.

**Action:** Immunosuppression thought to be mediated through a reduction in macrophage cell surface immunoglobulin receptors and a decrease in the amount of antibody on target cells.

**Use:** Adjunct therapy for canine immune-mediated haemolytic anaemia and thrombocytopenia. The onset of action may be slow, with the effects taking several weeks to become apparent.

**Safety and handling:** Should be handled with gloves as it is teratogenic.

**Contraindications:** Avoid use in patients with cardiac, renal or hepatic impairment. May alter insulin requirements in animals with diabetes mellitus. Do not use in pregnant animals.

**Adverse reactions:** Teratogenic. May cause hepatotoxicity. Other effects result from androgen actions: virilization in females, increased muscle mass, testicular atrophy, alopecia.
Drug interactions: Synergistic action with corticosteroids. Inhibits the metabolism of ciclosporin. Danazol should not be administered with anticoagulants as it may decrease synthesis of coagulation factors in the liver.

DOSES

Dogs: 4-10 mg/kg p.o. q8-12h, although an initial dose of 5 mg/kg p.o. q8h is suggested.

Cats: 5 mg/kg p.o. q8h.

Small mammals, Birds, Reptiles: No information available.

Dantron see Dantron

Dantrolene (Dantrium®) POM

Formulations: Oral: 25 mg, 100 mg capsules. Injectable: Vials of 20 mg dantrolene powder, 3 g mannitol and sodium hydroxide for reconstitution.

Action: Uncouples the excitation contraction process by preventing the release of calcium ions from the sarcoplasmic reticulum in striated muscle. As vascular smooth muscle and cardiac muscle are not primarily dependent on calcium release for contraction they are not usually affected.

Use: Management of muscle spasms (e.g. urethral muscle spasm, tetanus). Prevention (oral) or treatment (i.v.) of malignant hyperthermia. Each vial should be reconstituted with 60 ml of water.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Injectable preparation has pH 9.5 and is highly irritant when extravasated. A diuresis follows i.v. administration, reflecting its formulation with mannitol. Chronic use is associated with hepatitis and pleural effusion; monitor liver function during therapy. Generalized muscle weakness has been reported after overdose; initiate symptomatic supportive therapy and monitor the patient carefully.

Drug interactions: Do not combine with calcium-channel blockers such as verapamil.

DOSES

Dogs: Malignant hyperthermia: 2-5 mg/kg i.v.; Other indications: 0.5-2 mg/kg p.o. q12h.

Cats: 0.5-2 mg/kg p.o. q12h.

Small mammals, Birds, Reptiles: No information available.
Dantron (Danthon, Co-danthramer, Co-danthrusate) (Co-danthramer*, Co-danthrusate Suspension*, Normax*) POM

**Formulations:** Dantron is only marketed in combination products. Oral: Co-danthramer: dantron/poloxamer ‘188’ suspension 25/200 mg + 37.5/500 mg capsules; 5 mg/ml dantron + 40 mg/ml poloxamer suspension. Codanthrusate: 50 mg dantron + 60 mg docusate capsule.

**Action:** Stimulates mild peristaltic effect in the lower bowel. Docusate and poloxamer are softening agents.

**Use:** Faecal softener/stimulant used to treat constipation in older patients.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use if GI obstruction present, or during pregnancy or lactation.

**Adverse reactions:** Dantron is potentially hepatotoxic and carcinogenic in experimental animals and therefore use in humans is restricted to aged or terminally ill patients. However, chronic toxicity has not been seen in dogs.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 2.5-5.0 ml p.o. q12h.

**Cats:** 1.0-2.5 ml p.o. q12h.

**Small mammals, Birds, Reptiles:** No information available.

DAP see Dog appeasing pheromone

Dapsone (Dapsone*) POM

**Formulations:** Oral: 100 mg, 25 mg tablets.

**Action:** Proposed mechanisms include inhibition of the neutrophilic-cytotoxic system and interference with the alternate complement pathway. Also decreases antibody production and lysozymal enzyme synthesis. As an antibacterial, inhibits dihydropteroate synthase in susceptible organisms.

**Use:** Treatment of subcorneal pustular dermatitis, vasculitis and pemphigus. There is a lag phase of 4-8 weeks after starting treatment before effects are seen. Monitoring complete blood and platelet counts, chemistry analyses and urinalyses every 2-3 weeks for the first 4 months is recommended, at which point the frequency of monitoring can be reduced to every 3-4 months.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.
Adverse reactions: Side effects include anaemia, neutropenia, thrombocytopenia and hepatotoxicities. Cats have a greater sensitivity to dapsone, with a higher incidence of haemolytic anaemia and neurotoxicity.

Drug interactions: No information available.

DOSES

Dogs: 1 mg/kg q8-24h.

Cats: Do not use.

Small mammals, Birds, Reptiles: No information available.

Deferoxamine (Desferrioxamine) (Desferal*) POM

Formulations: Injectable: 500 mg vial for reconstitution.

Action: Deferoxamine chelates iron, and the complex is excreted in the urine.

Use: To remove iron from the body following poisoning. Also used for haemochromatosis (common in toucans, hornbills and softbills, though unusual in other birds).

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Administration i.m. is painful. Anaphylactic reactions and hypotension may develop if administered rapidly i.v.

Drug interactions: No information available.

DOSES

Dogs, Cats: 12.5-20 mg/kg diluted in 10-20 ml of water i.v., i.m. q2h for 2 doses, then 10 mg/kg i.v., i.m. q8h for 24h or 15 mg/kg/h i.v. infusion. Maximum 80 mg/kg or 6 g in 24 hours.

Small mammals: No information available.

Birds: various doses proposed, ranging from 20 mg/kg p.o. q4h to 40 mg/kg i.m. q24h (mynahs) to 100 mg/kg p.o., s.c., i.m. q24h for up to 3½ months.

Reptiles: No information available.

Delmadinone (Tardak) POM-V

Formulations: Injectable: 10 mg/ml suspension.

Action: Progestogens suppress FSH and LH production.

Use: Used in the treatment of hypersexuality (male dog and cat), prostatic hypertrophy, anal adenomas and hormonally driven canine aggression. In birds it may be useful for behavioural regurgitation or behaviour associated with sexual frustration. Dogs that show a reduced level of aggression when treated with delmadinone will not automatically show the same behavioural response to surgical
castration because the drug also has a central calming effect. In situations of fear- or anxiety-related aggressive behaviour, the surgical approach can exacerbate the behaviour.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Possible adverse effects include a transient reduction in fertility and libido, polyuria and polydipsia, an increased appetite and hair colour change at the site of injection.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 1.5-2 mg/kg (dogs <10 kg); 1-1.5 mg/kg (10-20 kg); 1 mg/kg (>20 kg) i.m., s.c. repeated after 8 days if no response. Animals that respond to treatment may need further treatment after 3-4 weeks.

**Cats:** 1.5 mg/kg repeated after 8 days if no response. Animals that respond to treatment may need further treatment after 3-4 weeks.

**Small mammals:** No information available.

**Birds:** 1 mg/kg i.m. once.

**Reptiles:** No information available.

---

**Deltamethrin** (Scalibor) POM-V

**Formulations:** Topical: 4% deltamethrin collar: 0.76 g (for small and medium dogs), 1.0 g (for large dog.

**Action:** Acts as a sodium ‘open channel blocker’ resulting in muscular convulsions and death in arthropods. It also repels ticks and insects.

**Use:** Control of tick infestation (*Ixodes ricinus*, *Rhipicephalus sanguineus*) and sand flies (*Phlebotomus perniciosus*) on dogs. May have additional repellant activity against fleas but should not be relied on for flea control.

**Safety and handling:** Wash hands after fitting the collar. Avoid letting children, in particular those under 2 years old, touch the collar, play with it or put it into their mouth.

**Contraindications:** Not for use in cats. Highly toxic to aquatic animals.

**Adverse reactions:** Avoid use in dogs with skin lesions.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** One collar q5-6months.

**Cats, Small mammals, Birds, Reptiles:** No information available.
Desmopressin (DDAVP*, Desmospray*, Nocutol*, Desmotabs*)
POM-V

**Formulations:** Intranasal: 100 µg/ml solution; 10 µg metered spray. Injectable: 4 µg/ml solution. Oral: 100 µg, 200 µg tablets.

**Action:** Binds to and stimulates ADH receptors in the collecting ducts of the kidney. Desmopressin, a vasopressin analogue, has a longer duration of action than vasopressin and, unlike vasopressin, has no vasoconstrictor activity.

**Use:** Diagnosis and treatment of central diabetes insipidus, and used to boost plasma levels of factor VIII and von Willebrand factor in patients with mild to moderate haemophilia A or von Willebrand’s disease. Further advice on the use of this drug in the modified water deprivation test should be obtained from relevant texts and specialist laboratories.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not perform the modified water deprivation test in patients with renal disease, dehydration or hypercalcaemia. Assess adrenocortical function before performing the test.

**Adverse reactions:** No information available

**Drug interactions:** No information available.

**DOSES**

**Dogs:**
- Coagulopathies: 1-4 µg/kg i.v. once; dilute in 20 ml saline and administer over 10 min.
- Diabetes insipidus diagnosis: (using modified water deprivation test): 1-4 µg/dog i.v. once.
- Diabetes insipidus treatment: 1-4 µg/dog i.v., i.m. or 5-20 µg/dog or 0.05-0.2 ml/dog intranasally or on to the conjunctiva q8-24h, or 5 µg/kg p.o. q8-24h initially (maximum dose 400 µg p.o. q8h). The dose and frequency of dosing can be increased or decreased according to response.

**Cats:** 5 µg/cat or 0.05 ml (1-2 drops) intranasally or on to the conjunctiva q8-24h, or 5 µg/cat p.o. q8-24h initially. The dose and frequency of dosing can be increased or decreased according to response.

**Small mammals, Birds, Reptiles:** No information available.
Dexamethasone (Aurizon, Dexadreson, Dexafort, Opticorten, Voren, Maxitrol®, Maxidex®) POM-V

Formulations: Ophthalmic: 0.1% solution (Maxitrol, Maxidex). Maxitrol also contains 6000 IU/ml polymyxin B, 3500 IU/ml neomycin. Injectable: 2 mg/ml solution; 1 mg/ml, 3 mg/ml suspension; 2.5 mg/ml suspension with 7.5 mg/ml prednisolone. Oral: 0.25 mg tablet. (1 mg of dexamethasone is equivalent to 1.1 mg of dexamethasone acetate, 1.3 mg of dexamethasone isonicotinate or dexamethasone sodium phosphate, or 1.4 mg of dexamethasone trioxa-undecanoate.)

Action: Alters the transcription of DNA, leading to alterations in cellular metabolism which cause reduction in inflammatory response.

Use: Used as an anti-inflammatory drug or in the management of shock and in the assessment of adrenal function in suspect cases of hyperadrenocorticism (HAC). Its anti-inflammatory potency is 7.5 times greater than prednisolone. On a dose basis 0.15 mg dexamethasone is equivalent to 1 mg prednisolone. Dexamethasone has a long duration of action and low mineralocorticoid activity; therefore, it is particularly suitable for short-term, high-dose therapy in conditions where water retention would be a disadvantage. It is unsuitable for long-term daily or alternate-day use. Animals on chronic therapy should be tapered off steroids when discontinuing the drug. Consult specialist texts and laboratories for advice on the performance and interpretation of dexamethasone suppression tests. Use shorter-acting preparations wherever possible in birds.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus. Impaired wound healing and delayed recovery from infections may be seen. Topical corticosteroids are contraindicated in ulcerative keratitis. Use glucocorticoids with care in rabbits as they are a corticosteroid-sensitive species and even small single doses can cause severe pathological changes.

Adverse reactions: A single dose of dexamethasone or dexamethasone sodium phosphate suppresses adrenal gland function for up to 32 h. Prolonged use of glucocorticoids suppresses the hypothalamic–pituitary axis (HPA), causing adrenal atrophy, elevated liver enzymes, cutaneous atrophy, weight loss, PU/PD, vomiting and diarrhoea. GI ulceration may develop. Hyperglycaemia and decreased serum T4 values may be seen in patients receiving dexamethasone. Corticosteroids should be used with care in birds as there is a high risk of immunosuppression and side effects, such as hepatopathy and a diabetes mellitus-like syndrome. Corticosteroids should be used with care in birds as there is a high risk of immunosuppression and side effects, such as hepatopathy and a diabetes mellitus-like syndrome.

Drug interactions: There is an increased risk of GI ulceration if used concurrently with NSAIDs. The risk of developing hypokalaemia is increased if corticosteroids are administered
concomitantly with amphotericin B or potassium-depleting diuretics (furosemide, thiazides). Dexamethasone antagonizes the effect of insulin. Phenobarbital or phenytoin may accelerate the metabolism of glucocorticoids.

**DOSES**

**Dogs:**
- Ophthalmic: Apply small amount of ointment to affected eye(s) q6-24h or 1 drop of solution in affected eye(s) q6-12h.
- Cerebral oedema or spinal cord trauma: 2-3 mg/kg i.v., then 1 mg/kg s.c. q6-8h, taper off.
- Inflammation: 0.01-0.16 mg/kg i.m., s.c., p.o. q24h for 3-5 days maximum.
- Immunosuppression: 0.3-0.64 mg/kg i.m., s.c., p.o. q24h for up to 5 days.
- Shock: 5 mg/kg i.v. using sodium phosphate salt.
- Assessment of adrenal function: low dose dexamethasone suppression test (0.015 mg/kg i.v.).

**Cats:**
- Ophthalmic, Cerebral oedema, Spinal cord trauma, Inflammation, Immunosuppression, Shock: doses as for dogs.
- Assessment of adrenal function: dexamethasone suppression test (0.15 mg/kg i.v.). NB: note difference to dogs.

**Small mammals:** Ferrets: 0.5-2.0 mg/kg s.c., i.m., i.v. q24h; shock: 4-8 mg/kg once using sodium phosphate salt; Rabbits: 0.2-0.6 mg/kg s.c., i.m., i.v. q24h; shock: 2 mg/kg i.v., i.m. once; Others: anti-inflammatory: 0.05-0.2 mg/kg i.m., s.c. q12-24h tapering dose over 3-14 days.

**Birds:** 2-6 mg/kg i.v., i.m. q12-24h.

**Reptiles:** 0.03-0.15 mg/kg i.m. q24h.

**Dexmedetomidine** (Dexdomitor) POM-V

**Formulations:** Injectable: 0.5 mg/ml solution.

**Action:** Agonist at peripheral and central alpha-2 adrenoreceptors producing dose-dependent sedation, muscle relaxation and analgesia.

**Use:** To provide sedation and premedication when used alone or in combination with opioid analgesics. Dexmedetomidine combined with ketamine is used to provide a short duration (20-30 min) of surgical anaesthesia in cats. Dexmedetomidine is the pure dextroenantiomer of medetomidine. As the levomedetomidine enantiomer is largely inactive, dexmedetomidine is twice as potent as the racemic mixture (medetomidine). Administration of dexmedetomidine reduces the biological load presented to the animal, resulting in quicker metabolism of concurrently administered anaesthetic drugs and a faster recovery from anaesthesia. Oxygen supplementation is
advisable in all animals that have received dexmedetomidine for sedation. The duration of analgesia from a 5 µg/kg dose of dexmedetomidine is approximately 1 hour. Combining dexmedetomidine with an opioid provides improved analgesia and sedation. Lower doses of dexmedetomidine should be used in combination with other drugs. Reversal of dexmedetomidine sedation or premedication with atipamezole at the end of the procedure shortens the recovery period, which is advantageous. Analgesia should be provided with other classes of drugs before atipamezole. The authorized dose range of dexmedetomidine for dogs and cats is very broad. High doses (>10 µg/kg) are associated with greater physiological disturbances than doses of 1-10 µg/kg. Using dexmedetomidine in combination with opioids in the lower dose range can provide good sedation and analgesia with minimal side effects.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in animals with cardiovascular or other systemic disease. Use of dexmedetomidine in geriatric patients is not advisable. It should not be used in pregnant animals, nor in animals likely to require or receiving sympathomimetic amines.

**Adverse reactions:** Causes diuresis by suppressing ADH secretion, a transient increase in blood glucose by decreasing endogenous insulin secretion, mydriasis and decreased intraocular pressure. Vomiting after i.m. administration is common, so dexmedetomidine should be avoided when vomiting is contraindicated (e.g. foreign body, raised intraocular pressure). Due to effects on blood glucose, use in diabetic animals is not recommended. Spontaneous arousal from deep sedation following stimulation can occur with all alpha-2 agonists, aggressive animals sedated with dexmedetomidine must still be managed with caution.

**Drug interactions:** No information available.

**DOSES**

**Dogs, cats:**
- Premedication: 5 µg/kg i.v., i.m, s.c. in combination with an opioid.
- Deep sedation: 10-15 µg/kg i.m. in combination with an opioid.

**Small mammals, Birds, Reptiles:** No information available.

**Dextran** (Dextran 40*, Dextran 60*, Dextran 70*) POM

**Formulations:** Injectable: dextran 40, 60 and 70 solutions. The number refers to the molecular weight of the dextran molecule in the different solutions.

**Action:** Promotes retention of fluid in the vascular system through the exertion of oncotic pressure.

**Use:** The expansion and maintenance of blood volume in various forms of shock, including hypovolaemic, traumatic, haemorrhagic and septic shock. Dextrans are supplied in low and high molecular weight
forms with plasma half-lives estimated to be 1-3 hours for dextran 40 and 2-6 hours for dextran 70. The plasma volume expansion achieved clinically per gram of dextran is roughly the same regardless of molecular weight. Clinically, dextran 40 has a greater concentration per millilitre and provides greater plasma volume expansion initially. Effects on blood clotting suggest that it may not be the best choice for fluid therapy when major surgery is planned.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in animals with congestive heart failure or renal insufficiency as dextrans increase the risk of circulatory overload. Dextrans may interfere with serum biochemistry and cross matching, thus blood samples should be collected prior to infusion. Dextrans should not be used in animals with bleeding disorders.

**Adverse reactions:** Dextrans tend to promote bleeding times by interfering with fibrin clot formation, reducing factor VIII and von Willebrand's factor and reducing platelet function. Allergic reactions have been reported in humans but not in dogs. A number of reports have linked dextrans to renal failure in humans due to increased viscosity of the glomerular filtrate associated with excretion of low molecular weight particles. There are no reports of renal failure after dextran administration to dogs and cats.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats, Small mammals:** 10-20 ml/kg/day i.v. infusion. Do not replace more than 25% of the circulating blood volume with dextrans in each 24 hour period.

**Birds, Reptiles:** No information available.

**Dextrose** see Glucose

**Diazepam** (Diazepam*, Diazemuls*, Valium*) POM

**Formulations:** Injectable: 5 mg/ml emulsion formulation (diazemuls), 5 mg/ml diazepam in propylene glycol. Oral: 2 mg, 5 mg, 10 mg tablets; 2 mg/5 ml solution. Rectal: 2 mg/ml, 4 mg/ml solutions in various sizes of tubes; 10 mg suppositories.

**Action:** Diazepam potentiates the effects of GABA, an inhibitory neurotransmitter, by binding to specific benzodiazepine receptors.

**Use:** Anticonvulsant, anxiolytic and skeletal muscle relaxant (e.g. urethral muscle spasm and tetanus). May be used in combination with ketamine to offset muscle hypertonicity associated with ketamine, and with opioids and/or acepromazine for pre-anaesthetic medication in the critically ill. It provides very poor sedation or even excitation when used alone. Diazepam is used in behavioural medicine for anxiety and fear-related disorders in dogs and cats,
especially where there are signs of panic. In addition, its amnesic properties mean it can be used during or immediately following an aversive experience to minimize the impact of such exposure. Best if used approximately 30 minutes before a fear-inducing event. Higher range doses are required for amnesic activity. Although it has been used for the management of urine spraying in cats, a high relapse rate upon withdrawal should be expected. Used in birds for the short-term management of feather plucking. It is used in cats as an appetite stimulant. Diazepam has a high lipid solubility, which facilitates its oral absorption and rapid central effects. Liver disease will prolong duration of action. In the short term repeated doses of diazepam or a constant rate infusion will lead to drug accumulation and prolonged recovery. Flumazenil (a benzodiazepine antagonist) will reverse the effects of diazepam. The development to benzodiazepams may occur after regular use, even with therapy of only a few weeks, and the dose should be gradually reduced in these cases if the benzodiazepine is being withdrawn.

**Safety and handling:** Substantial adsorption of diazepam may occur on to some plastics and this may cause a problem when administering diazepam by continuous i.v. infusion. The use of diazepam in PVC infusion bags should be avoided; giving sets should be kept as short as possible and should not contain a cellulose propionate volume-control chamber. If diazepam is given by continuous i.v. infusion the compatible materials include glass, polyolefin, polypropylene and polyethylene.

**Contraindications:** Benzodiazepines should be avoided in patients with CNS depression, respiratory depression, severe muscle weakness or hepatic impairment (as may worsen hepatic encephalopathy). They are also contraindicated in the long-term treatment of canine and feline behavioural disorders due to the risks of disinhibition and interference with memory and learning.

**Adverse reactions:** Sedation, muscle weakness and ataxia are common. Rapid i.v. injection or oral overdosage may cause marked paradoxical excitation (including aggression) and elicit signs of pain in normal dogs; i.v. injections should be made slowly (over at least 1 minute for each 5 mg). Intramuscular injection is painful and results in erratic drug absorption. The duration of action may be prolonged after repeated doses in rapid succession, in older animals, those with liver dysfunction, and those receiving beta-1 antagonists. Fulminant hepatic necrosis in cats has been associated with repeated oral administration. Chronic dosing leads to a shortened half-life due to activation of the hepatic microsomal enzyme system and tolerance to the drug may develop in dogs. The propylene glycol formulation of injectable diazepam can cause thrombophlebitis, therefore the emulsion formulation is preferred for i.v. injection.

**Drug interactions:** Do not dilute or mix with other agents. Due to extensive metabolism by the hepatic microsomal enzyme system, interactions with other drugs metabolized in this way are common. Cimetidine and omeprazole inhibit metabolism of diazepam and may prolong clearance. Concurrent use of phenobarbital may lead to a
decrease in the half-life of diazepam. An enhanced sedative effect may be seen if antihistamines or opioid analgesics are administered with diazepam, and diazepam will reduce the dose requirement of other anaesthetic agents. When given with diazepam the effects of digoxin may be increased. Diazepam may be used in combination with tricyclic antidepressant therapy for the management of more severe behavioural responses.

**DOSES**

**Dogs:**
- Anxiolytic: 0.55-2.2 mg/kg p.o as required.
- Skeletal muscle relaxation: 2-10 mg/dog p.o. q8h.
- Sedation and premedication: 0.2-0.5 mg/kg i.v., i.m.
- Emergency management of seizures, including status epilepticus: bolus dose of 0.5-1 mg/kg i.v. or intrarectally (if venous access is not available). Time to onset of clinical effect is 2-3 min for i.v. use; therefore repeat every 10 min if there is no clinical effect, up to three times. Additional doses may be administered if appropriate supportive care facilities are available (for support of respiration). Constant rate i.v. infusion for the control of status epilepticus or cluster seizures: initial rate of 0.5 mg/kg/h.

**Cats:**
- Anxiolytic: 0.2-0.4 mg/kg p.o. q8h.
- Appetite stimulant: 0.5-1.0 mg/kg i.v. once.
- Behavioural modification of urine spraying and muscle relaxation: 1.25-5 mg/cat p.o. q8h. The dose should be gradually increased to achieve the desired effect without concurrent sedation.
- Sedation and premedication: 0.2-0.5 mg/kg i.v., i.m.
- Emergency management of seizures including status epilepticus: bolus dose of 0.5-1 mg/kg i.v. or intrarectally if venous access is not available. Time to onset of clinical effect is 2-3 min for i.v. use, therefore repeat every 10 min if there is no clinical effect, up to maximum of three times. Constant rate i.v. infusion for the control of status epilepticus or cluster seizures: initial rate of 0.5 mg/kg/h. Care should be taken in cats to avoid overdosing: if cats demonstrate excessive sedation then diazepam should be discontinued.

**Small mammals:** Ferrets: 0.5-2 mg/kg p.o, i.v., i.m. q6-8h; sedative, anxiolytic and pruritic seizures: 2-5 mg/kg i.m. once (1 mg/kg i.m. or 2.5 mg/kg i.p. if used in conjunction with ketamine or fentanyl); Rabbits: 1-5 mg/kg i.v., i.m., i.p. once; Guinea pigs 0.5-5.0 mg/kg i.m. once; Chinchillas, Gerbils, Hamsters, Rats, Mice: 2.5-5 mg/kg i.m., i.p. once.

**Birds:**
- Convulsions/seizures: 0.1-1 mg/kg i.v., i.m. once.
- Premedicant: 0.2-0.5 mg/kg i.m., 0.05-0.15 mg/kg i.v. May be combined with ketamine for sedation.
• Anxiolytic: 0.5 mg/kg p.o. q8-12h.
• Appetite stimulant in raptors: 0.2 mg/kg p.o. q24h.

**Reptiles:**
• Seizures: 2.5 mg/kg i.m., i.v.
• Sedative: Chelonia: 0.2-1 mg/kg i.m.; Snakes: 0.2-0.8 mg/kg combined with 20-80 mg/kg ketamine i.m.

**Diazoxide** (Eudemine*) POM

**Formulations:** Injectable: 15 mg/ml solution. Oral: 50 mg tablet.

**Action:** A diuretic that causes vasodilation and inhibits insulin secretion by blocking calcium mobilization.

**Use:** Used to manage hypoglycaemia caused by hyperinsulinism in dogs and ferrets. In humans it is also used in the short-term management of acute hypertension.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** The commonest adverse effects are anorexia, vomiting and diarrhoea. Hypotension, tachycardia, bone marrow suppression, pancreatitis, cataracts and electrolyte and fluid retention may occur. Drug efficacy may diminish over a period of months.

**Drug interactions:** Phenothiazines and thiazide diuretics may increase the hyperglycaemic activity of diazoxide, whilst alpha-adrenergic blocking agents (e.g. phenoxybenzamine) may antagonize the effects of diazoxide.

**DOSES**

**Dogs:**
• Hypoglycaemia: 3.3 mg/kg p.o. q8h initially, increasing to 20 mg/kg p.o. q8h.
• Hypertension: 1-3 mg/kg rapid i.v. injection (<30 seconds); maximum single dose of 150 mg.

**Cats:** No information available.

**Small mammals:** Ferrets: 5-30 mg/kg p.o. q12h.

**Birds, Reptiles:** No information available.

**Dichlorophen** (Dichlorophen Tablets BP) AVM-GSL

**Formulations:** Oral: 500 mg tablet.

**Action:** Cestocide which acts by interfering with oxidative phosphorylation.

**Use:** Control of tapeworm infections in dogs and cats >6 months old. Effective against *Taenia* spp. and *Dipylidium* spp. but not *Echinococcus* spp. Affected worms are dislodged and disintegrate during their passage along the alimentary tract so they are not easily
recognizable when passed 6-8h after dosing. Administer tablets whole or crushed in food.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Vomiting may be seen.

**Drug interactions:** No information available.

**DOSES**

**Dog, Cats:** 250 mg total dose (dogs, cats <2.5 kg), 500 mg/2.5 kg (larger animals) p.o. Give maximum 6 tablets at one time, and give the rest 3 hours later if there is no vomiting.

**Small mammals, Birds, Reptiles:** No information available.

---

**Diclofenac** (Voltarol Ophtha*, Voltarol Ophtha Multidose*) POM

**Formulations:** Ophthalmic: 0.1% solution in in 5 ml bottle and in single-use vial.

**Action:** COX inhibitor that produces local anti-inflammatory effects.

**Use:** Used in cataract surgery to prevent intraoperative miosis and reflex (axonal) miosis caused by ulcerative keratitis. Used to control pain and inflammation associated with corneal surgery and in ulcerative keratitis when topical corticosteroid use is contraindicated.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** As with other topical NSAIDs, diclofenac may cause local irritation. Topical NSAIDs can be used with caution in ulcerative keratitis as they can delay epithelial healing. Topical NSAIDs, and most specifically diclofenac, have been associated with an increased risk of corneal ‘melting’ (keratomalacia) in humans, although this has not been reported in the veterinary literature. Topical NSAIDs have the potential to increase intraocular pressure and should be used with caution in dogs predisposed to glaucoma. Regular monitoring is advised. Use of systemic formulations has been associated with death in some species of bird.

**Drug interactions:** Ophthalmic NSAIDs may be used safely with other ophthalmic pharmaceuticals, although concurrent use of drugs which adversely affect the corneal epithelium (e.g. gentamicin) may lead to increased corneal penetration of the NSAID. The concurrent use of topical NSAIDs with topical corticosteroids has been identified as a risk factor in humans for precipitating corneal problems.

**DOSES**

**Dogs, Cats:** 1 drop q30min for 2 h prior to cataract surgery (there is a wide variation in protocols for cataract surgery).

**Small mammals:** No information available.

**Birds:** See note above on adverse reaction.

**Reptiles:** No information available.
**Difloxacin** (Dicural) POM-V

**Formulations:** Oral: 15 mg, 50 mg, 100 mg and 150 mg tablets. Injectable: 50 mg/ml solution.

**Action:** Bactericidal antimicrobial which works by inhibiting the bacterial DNA gyrase enzyme, causing damage to the bacterial DNA. The fluoroquinolones work in a concentration-dependent manner.

**Use:** Active against a wide range of Gram-negative organisms and also good to intermediate activity against Gram-positives (e.g. *Escherichia coli*, *Klebsiella* spp., *Pasteurella* spp., *Staphylococcus intermedius*, *Pseudomonas aeruginosa*). Activity against *Streptococcus* spp. and *Proteus* is intermediate. Activity against anaerobes is limited. Main indications include infections associated with the skin and soft tissues, and bacterial cystitis. Capable of achieving exceptionally high concentrations in the urinary tract. Fluoroquinolones should not be first line antimicrobials but should be reserved for situations where other antimicrobials are ineffective.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Due to concerns about the development of arthropathy in young animals, do not use in dogs <8 months old or <18 months in large and giant breeds.

**Adverse reactions:** Mild self-limiting GI disturbance has been reported. Fluoroquinolones have been associated with cartilage lesions in young animals. Neurotoxicity is associated with drug overdose.

**Drug interactions:** Substances containing divalent and trivalent cations, including sucrafate, antacids, multivitamins and compounds containing iron, magnesium, calcium and zinc, may interfere with the absorption of the drug from the GI tract.

**DOSES**

*Dogs:* 5 mg/kg p.o., s.c. q24h.

*Cats, Small mammals, Birds, Reptiles:* No information available.

**Digoxin** (Digoxin*, Lanoxin*, Lanoxin PG*) POM

**Formulations:** Injectable: 100 µg/ml, 250 µg/ml. Oral: 62.5 µg, 125 µg, 250 µg tablets; 50 µg/ml elixir.

**Action:** Inhibits Na⁺-K⁺ ATPase, leading to an increase in intracellular sodium. Sodium is exchanged for calcium, resulting in an increase in intracellular calcium and hence a positive inotropic effect. Digoxin acts on specialized conducting tissue and the sinoatrial node, increasing the refractory period, whilst decreasing conduction velocity and thereby slowing the heart rate. The combination of a slower heart rate and increased force of contraction increases cardiac output. Digoxin normalizes baroreceptor reflexes that are impaired in heart failure.
Use: Management of heart failure and supraventricular tachycardias, particularly atrial fibrillation. In ferrets and rabbits it is used in the treatment of dilated cardiomyopathy. It is a weak positive inotrope which is chiefly used to control heart rate in cases of heart failure with concurrent atrial fibrillation. Serum levels should be checked after 5-7 days. The bioavailability of digoxin varies between the different dosage routes: i.v. = 100%, tablets = 60% and elixir = 75%. If toxic effects are seen or the drug is ineffective, serum levels of digoxin should be assessed; the ideal therapeutic serum level is in the region of 1 ng/ml to optimize beneficial effects and minimize toxic side effects.

Safety and handling: Normal precautions should be observed.

Contraindications: Frequent ventricular arrhythmias or atrioventricular block. Decreased dosages or an increase in dosing intervals may be required in geriatric patients, obese animals or those with significant renal dysfunction. The use of the i.v. route is rarely indicated; administer i.v. slowly with extreme care, as it may cause vasoconstriction.

Adverse reactions: Cats are more sensitive to the toxic effects of digoxin than dogs. Signs of toxicity include anorexia, vomiting, diarrhoea, depression or arrhythmias (e.g. heart block, bigeminy, paroxysmal ventricular or atrial tachycardias with block, and multifocal ventricular premature contractions). Lidocaine, phenytoin and procainamide may be used to control digoxin-associated arrhythmias.

Drug interactions: Antacids, chemotherapy agents (e.g. cyclophosphamide, cytarabine, doxorubicin, vincristine), cimetidine and metoclopramide may decrease digoxin absorption from the GI tract. The following may increase the serum level, decrease the elimination rate or enhance the toxic effects of digoxin: antimuscarinics, diazepam, erythromycin, loop and thiazide diuretics (hypokalaemia), quinidine, oxytetracycline and verapamil. Spironolactone may enhance or decrease the toxic effects of digoxin.

DOSES

Dogs: 2.2-4.4 µg/kg i.v. q12h, 5.5-11 µg/kg p.o. q12h (tablets), 5-8 µg/kg p.o. q12h (elixir). For larger dogs (>22 kg) a more accurate dosing regimen is 0.22 mg/m².

Cats: 1-1.6 µg/kg i.v. q12h, 10 µg/kg p.o. q24-48h, 1/4 of a 125 µg tablet q24-48h.

Small mammals: Ferrets: 0.005-0.01 mg/kg p.o. q12h; Rabbits: 0.005-0.01 mg/kg p.o. q24-48h; Hamsters: 0.05-0.1 mg/kg p.o. q12-24h.

Birds: Raptors: 0.02-0.05 mg/kg p.o. q12h for 2-3 days then reduce to 0.01 mg/kg q12-24h; Pigeons, Parrots: 0.02mg/kg p.o. q24h.

Reptiles: No information available.
Diltiazem (Hypercard, Diltiazem) POM-V

Formulations: Oral: 10 mg (Hypercard), 60 mg (generic) tablets. Long-acting preparations authorized for humans, such as Dilcardia SR (60 mg, 90 mg, 120 mg capsules), are available but their pharmacokinetics have been little studied in animals to date.

Action: Interferes with the inward movement of calcium ions through slow channels in myocardial cells and cells within the specialized conduction system in the heart and vascular smooth muscle; vascular smooth muscle is more sensitive to diltiazem than myocardial tissues (relative activity of 7:1). Systemic resistance vessels and large arteries respond to calcium-channel blockers more readily than venous capacitance vessels and pulmonary vasculature. Diltiazem causes a reduction in myocardial contractility (negative inotrope, although less effective than verapamil), depressed electrical activity (retarded atrioventricular conduction) and decreases vascular resistance (vasodilation of cardiac vessels and peripheral arteries and arterioles).

Use: Primarily used to control supraventricular tachyarrhythmias although it is authorized for use in cats with hypertrophic cardiomyopathy. It is also used in ferrets for hypertrophic cardiomyopathy. In dogs with atrial fibrillation it may be given as well as digoxin if the latter has not controlled the heart rate sufficiently well. Diltiazem is preferred to verapamil by many because it has effective antiarrhythmic properties with minimal negative inotropy. Diltiazem is less effective than amlodipine in the management of hypertension. In cats with hypertrophic cardiomyopathy beta-blockers are now more commonly used than diltiazem.

Safety and handling: Normal precautions should be observed.

Contraindications: Diltiazem is contraindicated in patients with second or third degree heart block, marked hypotension, sick sinus syndrome, or with severe left ventricular dysfunction. Reduce the dose of diltiazem if hepatic or renal impairment exists.

Adverse reactions: In dogs, bradycardia is the commonest adverse effect, whilst in cats it is vomiting. Lethargy can be seen in both species.

Drug interactions: If diltiazem is administered concurrently with beta-adrenergic blockers (e.g. propranolol), there may be additive negative inotropic and chronotropic effects. Diltiazem’s activity may be adversely affected by calcium salts or vitamin D. Plasma digoxin values are increased by diltiazem. Monitoring of digoxin serum levels is recommended if used concurrently with diltiazem. Cimetidine inhibits the metabolism of diltiazem, thereby increasing plasma concentrations. Diltiazem enhances the effect of theophylline, which may lead to toxicity. It may affect quinidine and ciclosporin concentrations. Diltiazem may displace highly protein-bound agents from plasma proteins. Diltiazem may increase intracellular vincristine levels by inhibiting the drug’s outflow from the cell.

DOSES
Long-acting preparations have been used at a dose of 10 mg/kg p.o. q24h but there is little experience with such formulations in animals.
**Dogs:** 0.5-2.0 mg/kg p.o. q8h. The lower doses are used in the presence of heart failure.

**Cats:** 0.5-2.5 mg/kg p.o. q8h, or one 10 mg tablet for cats of 3-6.25 kg p.o. q8h.

**Small mammals:** Ferrets: 1.5-7.5 mg/kg p.o. q12h.

**Birds, Reptiles:** No information available.

**Dimercaprol (British anti-lewisite) (Dimercaprol*) POM**

**Formulations:** Injectable: 50 mg/ml solution in peanut oil.

**Action:** Chelates heavy metals.

**Use:** Treatment of acute toxicity caused by arsenic, gold, bismuth and mercury, and used as an adjunct (with edetate calcium disodium) in lead poisoning.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Severe hepatic failure. Iron salts should not be administered during therapy.

**Adverse reactions:** Intramuscular injections are painful. Dimercaprol-metal complexes are nephrotoxic. This is particularly so with iron, selenium or cadmium; do not use for these metals. Alkalinization of urine during therapy may have protective effects for the kidney.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 2.5-5 mg/kg i.m. q4h for 2 days, then q8h for 10 days or until recovery. (Note: the 5 mg/kg dose should only be used on the first day when severe acute intoxication occurs.) Arsenic poisoning when gastroenteritis is present: 6-7 mg/kg i.m. q8h or 3-4 mg/kg i.m. q6h. Increase intervals between doses on 3rd day and q12h dosing at the lower dosage levels may begin on day 4; continue to day 10. Aggressive supportive therapy should be maintained throughout the treatment period.

**Small mammals:** No information available.

**Birds:** 2.5 mg/kg i.m. q4h for 2 days then q12h until signs resolve.

**Reptiles:** No information available.

**Dimethylsulfoxide (DMSO) (Rimso-50*) POM**

**Formulations:** Injectable: 50%, 90% liquid; medical grade only available as a 50% solution, other formulations are available as an industrial solvent. Topical: 70%, 90% gel; 70% cream.

**Action:** The mechanism of action is not well understood. Antioxidant activity has been demonstrated in certain biological settings and is thought to account for the anti-inflammatory activity.
**Use:** Management of otitis externa and haemorrhagic cystitis induced by cyclophosphamide. Although efficacy is unproven it has been used to decrease intracranial pressure following CNS trauma and in the treatment of renal amyloidosis. In humans, DMSO is authorized for the treatment of interstitial cystitis. DMSO is very rapidly absorbed through the skin following administration by all routes and is distributed throughout the body. Metabolites of DMSO are excreted in the urine and faeces. DMSO is also excreted through the lungs and skin, producing a characteristic sulphuric odour. Humans given DMSO experience a garlic-like taste sensation after administration.

**Safety and handling:** Should be kept in a tightly closed container because it is very hygroscopic. Gloves should be worn during topical application and the product should be handled with care.

**Contraindications:** No information available.

**Adverse reactions:** Changes in refractive index and lens opacities have been seen in dogs given high doses of DMSO chronically, these are slowly reversible upon discontinuation of the drug. Other adverse effects include local irritation and erythema caused by local histamine release. Administration i.v. of solutions with concentrations >20% may cause haemolysis and diuresis.

**Drug interactions:** DMSO should not be mixed with other potentially toxic ingredients when applied to the skin because of profound enhancement of systemic absorption.

**DOSES**

**Dogs:**
- Otic: 4-6 drops of a 60% solution in affected ear q12h for up to 14 days.
- CNS trauma: 1 g DMSO i.v. over 45 min. Use a 10% solution. The lethal dose for 50% of dogs (LD₅₀) for DMSO is 2.5 g/kg.
- Renal amyloidosis: 80 mg/kg s.c. 3 times/week; 125-300 mg/kg p.o. q24h.
- Topical: Apply 90% solution to affected areas q8-12h. Total daily dose should not exceed 20 ml. Do not apply for longer than 14 days.

**Cats, Small mammals:** No information available.

**Birds:** May be applied topically to lesions, e.g. bumblefoot, as an anti-inflammatory presurgery. May be combined with other drugs as a carrying agent.

**Reptiles:** No information available.

**Dinoprost tromethamine** *(Prostaglandin F2) (Enzaprost*, Lutalyse*) POM-V

**Formulations:** Injectable: 5 mg/ml solution.

**Action:** Prostaglandins stimulate uterine contraction, cause cervical relaxation and inhibit progesterone production by the corpus luteum.
Use: Used in the termination of pregnancy at any stage of gestation and to stimulate uterine contractions in the treatment of open pyometra.

Safety and handling: Pregnant woman and asthmatics should avoid handling this agent.

Contraindications: Do not use for the treatment of closed pyometra as there is a risk of uterine rupture.

Adverse reactions: Hypersalivation, panting, tachycardia, vomiting, urination, defecation, transient hyperthermia, locomotor incoordination and mild CNS signs have been reported. Such effects usually diminish within 30 min of drug administration. There is no adverse effect on future fertility. Severe adverse effects are reported in birds.

Drug interactions: The effect of oxytocin would be potentiated by prostaglandins and inhibited by progestagens.

DOSES

Dogs:
- Abortifacient: First half of gestation: 0.05-0.25 mg/kg s.c. q12h for 4 days starting at least 5 days after the onset of cytological dioestrus. Second half of gestation: 0.05-0.25 mg/kg s.c. q12h until abortion is complete; monitor radiographically or ultrasonographically. Use low doses initially (0.05-0.1 mg/kg q12h) to assess the severity of any adverse effects. Assess serum progesterone concentration at the end of treatment to ensure that complete luteolysis has occurred.
- Open pyometra: 0.1-0.25 mg/kg s.c. q12h until the uterus is empty; usually 3-5 days treatment required.

Cats: Abortifacient: 0.025 mg/kg s.c. q24h for up to 5 days, after day 40 of pregnancy.

Small mammals: No information available.

Birds: Do not use.

Reptiles: No information available.

Dinoprostone (Prostaglandin E2) (Prostin E2*) POM

Formulations: Topical: 0.4 mg/ml gel.

Action: Prostaglandins stimulate uterine contraction, cause cervical relaxation and inhibit progesterone production by the corpus luteum.

Use: Used to relax the vagina and induce uterine contractions in egg-bound birds.

Safety and handling: Pregnant woman and asthmatics should avoid handling this agent.

Contraindications: No information available.

Adverse reactions: Uterine rupture may occur.

Drug interactions: No information available.
DOSES

**Birds:** Apply a thin layer of gel to the cloacal mucosa once.

**Dogs, Cats, Small mammals, Reptiles:** No information available.

Dioctyl sodium sulfosuccinate see Docusate sodium

**Diphenhydramine** (Dreemon*, Medinex*, Nytol*) P

**Formulations:** Oral: 25 mg tablet; 2 mg/ml solution. Other products are available of various concentrations and most contain other active ingredients.

**Action:** The antihistaminergic (H1) effects are used to reduce pruritus and prevent motion sickness.

**Use:** Control of mild anxiety conditions in dogs and cats, including anxiety related to car travel. Management of night-time activity in cats and compulsive scratching. In birds it is used in the management of allergic rhinitis and hypersensitivity reactions. In ferrets it is used before vaccination if a previous vaccine reaction has been encountered. Liquid is very distasteful.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Urine retention, glaucoma and hyperthyroidism.

**Adverse reactions:** Paradoxical excitement may be seen in cats.

**Drug interactions:** An increased sedative effect may occur if used with benzodiazepines or other anxiolytics/hypnotics. Avoid the concomitant use of other sedative agents. Diphenhydramine may enhance the effect of adrenaline and partially counteract anticoagulant effects of heparin and warfarin.

**DOSES**

**Dogs:**
- Cough suppression and antiemesis: 2-4 mg/kg p.o. q6-8h.
- Suppression of pruritus: 1-2 mg/kg p.o. q8-12h.

**Cats:** 2-4 mg/kg p.o. q6-8h, 1 mg/kg i.v., i.m. q8h.

**Small mammals:** Ferrets: 0.5-2 mg/kg p.o. q8-12h; Guinea pigs: 5 mg/kg s.c. prn; Chinchillas, Hamsters, Rats, Mice: 1-2 mg/kg p.o., s.c. q12h.

**Birds:** 2-4 mg/kg p.o. q12h.

**Reptiles:** No information available.
**Diphenoxylate** *(Co-phenotrope) (Lomotil* (with atropine))

**POM**

**Formulations:** Oral: 2.5 mg diphenoxylate + 0.025 mg atropine tablet.

**Action:** Increases intestinal segmental smooth muscle tone, decreases the propulsive activity of smooth muscle, and decreases electrolyte and water secretion into the intestinal lumen. Atropine is added in a sub-therapeutic dose to discourage abuse by diphenoxylate overdose.

**Use:** Management of acute diarrhoea and irritable bowel syndrome in dogs. Concurrent correction of water and electrolyte imbalance is indicated whilst investigations into the cause of the diarrhoea are undertaken. Little is known about the safety and efficacy of Lomotil in cats.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Intestinal obstruction.

**Adverse reactions:** Sedation, constipation and ileus. Do not use in animals with liver disease, intestinal obstruction, neoplastic or toxic bowel disease.

**Drug interactions:** Diphenoxylate may potentiate the sedative effects of barbiturates and other tranquillizers.

**DOSES**

**Dogs:** 0.05-0.1 mg/kg diphenoxylate p.o. q6-8h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Dipyprone see Metamizole**

**Dirlotapide** *(Slentrol) POM-V

**Formulations:** Oral: 5 mg/ml solution.

**Action:** Causes a reduced uptake of dietary lipids, dose-dependent decrease in serum cholesterol and triglyceride, and an increased presence of triglyceride-containing droplets in enterocytes. Also has a slight appetite decreasing effect.

**Use:** Aid to the management of overweight and obese adult dogs. Should be used as part of an overall weight management programme. In clinical trials, treated animals rapidly regained weight following cessation of treatment when diet was not restricted. Treatment should be given with food. Duration of treatment must not exceed 12 months.

**Safety and handling:** Light-sensitive. Store in the original container.

**Contraindications:** Do not use in dogs that are pregnant, lactating, <18 months of age or that have impaired liver function. Do not use in dogs in which overweight or obesity is caused by a concomitant systemic disease (e.g. hypothyroidism, hyperadrenocorticism). Not authorized or recommended in cats due to risk of hepatic lipidosis.
Adverse reactions: Vomiting, diarrhoea or softened stools may occur during treatment. Reversible decreases in serum albumin, globulin, total protein, calcium and alkaline phosphatase and increases in ALT, AST and potassium may occur.

Drug interactions: Unknown at this time therefore do not mix with other drugs.

DOSES

Dogs: 0.05 mg/kg initial body weight per day (0.01 ml/kg/day). After 2 weeks of therapy, the initial dose should be increased by 100% for a further 2 weeks. Following these initial 4 weeks of therapy, dogs should be weighed monthly during treatment with the product and dose adjustments made according to effect. The aim is to achieve a 3% weight loss per month. If this is not achieved then the dose can be increased by 50%, up to a maximum dose of 0.2 ml/kg. If weight loss is excessive then the dose should be reduced by 25%. A mean weight loss of about 18-20% after 6 months of therapy can be anticipated.

Cats, Small mammals: Do not use.

Birds, Reptiles: No information available.

Dobutamine (Dobutamine*, Dobutrex*, Posiject*) POM

Formulations: Injectable: 12.5 mg/ml, 50 mg/ml solution.

Action: Direct-acting synthetic catecholamine derivative of isoprenaline. Positive inotropy results primarily from stimulation of the beta-1 adrenoreceptors of the heart, while producing less marked chronotropic, hypertensive, arrhythmogenic and vasodilatory effects. Dobutamine does not cause the release of endogenous noradrenaline.

Use: Short-term inotropic support of patients with cardiac failure due to decreased contractility (e.g. dilated cardiomyopathy), septic and cardiogenic shock. It is used to support myocardial function during anaesthesia in animals that are hypotensive when reduced myocardial contractility is suspected as the primary cause. Dobutamine is a potent and short-acting drug, therefore it should be given in low doses by continuous rate infusion; accurate dosing is important. The dose of dobutamine should be adjusted according to clinical effect, therefore monitoring of direct arterial blood pressure during administration is advisable. Sudden increases in blood pressure may cause severe bradycardia – dobutamine should be stopped immediately until heart rate recovers to normal values. All sympathomimetic drugs have pro-arrhythmic properties, therefore the ECG should be monitored during drug infusion.

Safety and handling: Dilute to a 25 µg/ml solution in dextrose or normal saline and store solution in the fridge when not in use. Degradation of dobutamine solution causes a pink discoloration. The reconstituted solution is stable for at least 24h, after this discoloured solutions should be discarded.
Contraindications: Should be avoided in patients with a cardiac outflow obstruction (e.g. aortic stenosis).

Adverse reactions: Dobutamine is short-acting, therefore adverse reactions such as tachycardia, hypertension or bradycardia can usually be managed by stopping the drug infusion and waiting for these parameters to return to normal values. In cases of atrial fibrillation pretreat with digoxin prior to administering dobutamine and even then use it with great caution.

Drug interactions: Diabetic patients treated with dobutamine may experience increased insulin requirements. Increased systemic vascular resistance may develop if dobutamine is administered with beta-blocking drugs such as propanolol, doxapram or monoamine oxidase inhibitors (e.g. selegiline). Concomitant use with halothane may result in an increased incidence of arrhythmias. Clinical studies in humans indicate that concomitant use of dobutamine and nitroprusside results in a higher cardiac output than when either drug is used alone.

DOSES

Dogs: 5-20 µg/kg/min i.v. by constant rate infusion. Start at the bottom end of the dose range and increase slowly until the desired effect is achieved. Administer with an i.v. infusion pump or other i.v. flow controlling device.

Cats: 2-5 µg/kg/min i.v. by constant rate infusion. Start at the bottom end of the dose range and increase slowly until the desired effect is achieved. Administer with an i.v. infusion pump or other i.v. flow controlling device.

Small mammals, Birds, Reptiles: No information available.

Docusate sodium (Dioctyl sodium sulfosuccinate (DSS)) (Codanthrusate*, Docusol*, Norgalax*, Waxsol*) P, GSl

Formulations: Oral: 100 mg capsule (Dioctyl); 2.5 mg/ml liquid (Docusol Paediatric Solution), 10 mg/ml liquid (Docusol), 50 mg dantron plus 60 mg docusate/5 ml (Co-danthrusate). Rectal: 120 mg ene ema (Norgalax). Topical: 0.5% docusate in water-miscible base (Waxsol). Docusate is also a component of many other mixed topical preparations.

Action: Anionic surfactant acting as emulsifying, wetting and dispersing agent.

Use: Constipation and ceruminous otitis.

Safety and handling: Normal precautions should be observed.

Contraindications: Intestinal obstruction.

Adverse reactions: Avoid the concurrent use of docusate and mineral oil.

Drug interactions: No information available.
DOSES

Dogs:
- Constipation: 50-100 mg p.o. q12-24h or 10-15 ml of 5% solution mixed with 100 ml of water instilled per rectum prn.
- Otitis: A few drops in the affected ear q8-12h or 5-15 min prior to flushing.

Cats:
- Constipation: 50 mg p.o. q12-24h or 2 ml of a 5% solution mixed with 50 ml of water instilled per rectum prn.
- Otitis: dose as for dogs.

Small mammals, Birds, Reptiles: No information available.

Dog appeasing pheromone (Appeasines, DAP) (D.A.P) 
GSL

Formulations: Plug-in diffuser, topical environmental spray, collar.

Action: The substance is derived from components of the chemical secretions produced by the bitch after whelping, which help to orientate pups towards the safety of the den. The signal has an innate action and does not require learning. A similar signal appears to form part of the social signal controlling groups of adult dogs. Detection of the substance in the aerial environment results in limbic activity which helps to antagonize the effect of certain forms of aversion in the environment.

Use: Helps control signs of stress associated with separation, noise sensitivity, travel, introduction to a new home, visits to a novel environment (e.g. veterinary clinic) and other anxiogenic circumstances. The diffuser should be placed in the room most frequently occupied by the dog and, in the management of behavioural disorders, where the inappropriate behaviour most frequently occurs. For behavioural problems involving hyperattachment to the owner, a treatment period of 3 months is recommended. The spray can be used inside and outside the home environment. It can be used in cars, hospitalization cages, kennels, indoor pens or refuge areas, and applied directly on to bedding. It can be sprayed with the bottle in an upside down position. The collar formulation is particularly useful to help control reactions which occur outside the home. If multiple dogs are affected by a problem, each dog should wear a collar and possibly a diffuser considered for problems based around the home.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not spray directly on to animals or near an animal’s face. The collar formulation should not be used for animals with a known reactivity to collars. Avoid contact with water when the collar is in use as this may wash out the active ingredients.

Adverse reactions: None.
Drug interactions: None known, although anecdotally an apparently synergistic action with benzodiazepines has been reported in some instances.

APPLICATION

Dogs: The diffuser is active over an area of approximately 50-70 m². If the total target area exceeds this, a second diffuser should be used. One vial will last for approximately 4 weeks of continuous use. It should not be repeatedly switched on and off. Follow manufacturer’s instructions for each formulation. In the house, DAP spray can complement the use of the diffuser device where a more local application is needed. Spray 8-10 pumps of DAP on to the required surface 15 min before results are expected and before the dog is introduced into the environment to allow the alcohol carrier to evaporate. The effect should last for 1-2 h, although each animal will respond individually. The application can be renewed after 1-2 h or when the effects appear to be reducing.

Cats, Small mammals, Birds, Reptiles: Not applicable.

Domperidone (Domperidone*, Motilium*) POM

Formulations: Oral: 10 mg tablet, 1 mg/ml suspension.

Action: A potent antiemetic with a similar mechanism of action to metoclopramide, but with fewer adverse CNS effects as it cannot penetrate the blood-brain barrier. It is gastrokinetic in humans but may not be a prokinetic in dogs.

Use: Treatment of vomiting. However, maropitant is authorized for veterinary use and there is more clinical experience with metoclopramide and ondansetron.

Safety and handling: Normal precautions should be observed.

Contraindications: Intestinal obstruction or perforation.

Adverse reactions: There is little information on the use of this drug in veterinary medicine, but it may cause gastroparesis in dogs.

Drug interactions: No information available.

DOSES

Dogs, Cats: 2-5 mg per animal q8h.

Small mammals, Birds, Reptiles: No information available.

Dopamine (Dopamine*) POM

Formulations: Injectable: 200 mg in 5 ml vial (40 mg/ml solution), 800 mg in a 5 ml vial (160 mg/ml solution).

Action: Dopamine is an endogenous catecholamine and precursor of noradrenaline.

Use: Improvement of haemodynamic parameters and urine output. Support of blood pressure during anaesthesia. Dopamine is a potent and short-acting drug, therefore it should be given in low doses by
continuous rate infusion, and accurate dosing is important. Dopamine should be diluted in normal saline to an appropriate concentration. At low doses (<10 µg/kg/min) dopamine acts on dopaminergic and beta-1 receptors, causing vasodilation and resulting in an increase in organ perfusion, renal blood flow and urine production, and cardiac output; systemic vascular resistance remains largely unchanged. At higher doses (>10 µg/kg/min) dopaminergic effects are overridden by the alpha and beta effects, resulting in an increase in systemic vascular resistance, heart rate and force of contraction, but reduced renal and peripheral blood flow. Dopamine has been shown to vasodilate mesenteric blood vessels via D1 receptors. However, the improvement in urine output may be entirely due to inhibition of proximal tubule Na⁺ reabsorption and an improved cardiac output and blood pressure.

**Safety and handling:** Solution should be discarded if it becomes discoloured.

**Contraindications:** Discontinue or reduce the dose of dopamine should cardiac arrhythmias arise.

**Adverse reactions:** Extravasation of dopamine causes necrosis and sloughing of surrounding tissue due to tissue ischaemia. Should extravasation occur, infiltrate the site with a solution of 5-10 mg phentolamine in 10-15 ml of normal saline using a syringe with a fine needle. Sudden increases in blood pressure may cause a severe bradycardia – dopamine should be stopped immediately until heart rate recovers to normal values. All sympathomimetic drugs have pro-arrhythmic properties, therefore the ECG should be monitored during drug infusion.

**Drug interactions:** Risk of severe hypertension when monoamine oxidase inhibitors, doxapram and oxytocin are used with dopamine. Halothane may increase myocardial sensitivity to catecholamines. Propanolol can be used to treat dopamine-induced ventricular arrhythmias.

**DOSES**

**Dogs:** 2-10 µg/kg/min i.v. as a constant rate infusion.

**Cats:** 1-5 µg/kg/min i.v. as a constant rate infusion.

**Small mammals:** Guinea pigs: 0.08 mg/kg i.v. once.

**Birds, Reptiles:** No information available.

---

**Dorzolamide** *(Trusopt* CoSopt*) POM

**Formulations:** Ophthalmic drops: 20 mg/ml (2%) *(Trusopt)*, 2% dorzolamide + 0.5% timolol *(CoSopt)*.

**Action:** Reduces intraocular pressure by reducing the rate of aqueous humour production by inhibiting the formation of bicarbonate ions within the ciliary body epithelium.

**Use:** In the control of all types of glaucoma in dogs and cats, either alone or in combination with other topicals. Dorzolamide/timolol combination may be more effective in dogs than either drug alone. It may be less tolerated than brinzolamide due to a less physiological
pH of 5.6. The concurrent use of a topical and systemic carbonic anhydrase inhibitor is not beneficial as there is no additional decrease in intraocular pressure compared with the sole use of either topical or systemic treatment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Dorzolamide/timolol causes miosis and is therefore not the drug of choice in uveitis or anterior lens luxation. Contraindicated in severe hepatic or renal impairment.

**Adverse reactions:** Local irritation and blepharitis. Dorzolamide may cause more local irritation than brinzolamide.

**Drug interactions:** No information available.

**DOSES**
- **Dogs:** 1 drop/eye q8h.
- **Cats:** 1 drop/eye q12h.
- **Small mammals:** No information available.
- **Birds:** 1 drop/eye q12h.
- **Reptiles:** No information available.

---

**Doxapram** (Dopram-V) POM-VPS, POM-V

**Formulations:** Injectable: 20 mg/ml solution. Oral: 20 mg/ml drops.

**Action:** Stimulates respiration by increasing the sensitivity of aortic and carotid body chemoreceptors to arterial gas tensions.

**Use:** Stimulates respiration during and after general anaesthesia. In neonatal puppies and kittens, used to stimulate or initiate respiration after birth, particularly in animals born by caesarean section. The dose should be adjusted according to the requirements of the situation, adequate but not excessive doses should be used. A patent airway is essential.

**Safety and handling:** Protect from light.

**Contraindications:** Must not be used indiscriminately to support respiratory function and must only be used when the airway is patent. Severe respiratory depression should be controlled by tracheal intubation, followed by intermittent positive pressure ventilation, and then resolution of the initiating cause.

**Adverse reactions:** Overdose can cause excessive hyperventilation, which may be followed by reduced carbon dioxide tension in the blood leading to cerebral vasoconstriction. This could result in cerebral hypoxia in some animals. Doxapram is irritant and may cause a thrombophlebitis, avoid extravasation or repeated i.v. injection into the same vein. Use doxapram injection with caution in neonates because it contains benzyl alcohol which is toxic. Overdosage symptoms include hypertension, skeletal muscle hyperactivity, tachycardia and generalized CNS excitation including seizures; treatment is supportive using short-acting i.v. barbiturates or propofol and oxygen. Effects in pregnant/lactating animals are not known.
Drug interactions: Hypertension may occur with sympathomimetics. The use of theophylline concurrently with doxapram may cause increased CNS stimulation. As doxapram may stimulate the release of adrenaline, its use within 10 min of the administration of anaesthetic agents that sensitize the myocardium to catecholamines (e.g. halothane) should be avoided. Doxapram is compatible with 5% dextrose or normal saline but is incompatible with sodium bicarbonate or thiopental. High doses administered during or after anaesthesia with halogenated hydrocarbon anaesthetics, such as halothane, may precipitate cardiac arrhythmias. Doxapram injection should be used with extreme caution in dogs that have been sedated with morphine. Administration of doxapram at 10 mg/kg to such animals may be followed by convulsions.

DOSES

Dogs, Cats: 5-10 mg/kg i.v., repeat according to need, duration of effect is approximately 15-20 min. Neonates: 1-2 drops under the tongue (oral solution) or 0.1 ml i.v. into the umbilical vein; this should be used only once.

Small mammals: Guinea pigs: 2-5 mg/kg i.v., s.c., i.p. once. Chinchillas, Gerbils, Hamsters, Rats, Mice: 5-10 mg/kg i.v., i.p. once.

Birds: 5-20 mg/kg i.m., i.v., intratracheal, intraoesophageous once.

Reptiles: 4-12 mg/kg i.m., i.v., p.o. once.

Doxepin (Sinepin®) POM

Formulations: Oral: 25 mg, 50 mg capsules.

Action: Doxepin blocks noradrenaline and serotonin re-uptake in the brain, resulting in antidepressive activity, while the H1 and H2 blockage result in antipruritic effects. Its metabolite, desmethyldoxepin, is also psychoactive.

Use: Management of pruritus and psychogenic dermatoses where there is a component of anxiety, including canine acral lick dermatitis and compulsive disorders. Data are lacking as to its efficacy at the suggested doses. The atypical tricyclic antidepressant clomipramine is an authorized preparation for use in dogs. Also used in birds for organophosphate toxicity. When used in birds it is important to monitor for cardiac arrhythmias.

Safety and handling: Normal precautions should be observed.

Contraindications: Hypersensitivity to tricyclic antidepressants, glaucoma, history of seizure or urinary retention and severe liver disease.

Adverse reactions: Sedation, dry mouth, diarrhoea, vomiting, excitability, arrhythmias, hypotension, syncope, increased appetite, weight gain and, less commonly, seizures and bone marrow disorders have been reported in humans.

Drug interactions: Should not be used with monoamine oxidase inhibitors or drugs which are metabolized by cytochrome P450 2D6, e.g. chlorphenamine and cimetidine.
DOSES

**Dogs:** 3-5 mg/kg p.o. q12h, maximum dose 150 mg q12h.

**Cats:** 0.5-1.0 mg/kg p.o. q12-24h.

**Small mammals:** No information available.

**Birds:** Feather plucking: 0.5-1 mg/kg p.o. q12h; organophosphate toxicity: 0.2 mg/kg i.m. q4h.

**Reptiles:** No information available.

**Doxorubicin** (Doxorubicin*) POM

**Formulations:** Injectable: 10 mg, 50 mg powders for reconstitution; 10 mg, 50 mg/vial solutions.

**Action:** Inhibits DNA synthesis and function.

**Use:** Treatment of lymphoma, soft tissue sarcomas, osteosarcoma and haemangiosarcoma, and may have a role in the management of carcinomas in the dog and soft tissue sarcomas in the cat. It may be used alone or in combination with other antineoplastic therapies. Premedication with i.v. diphenhydramine, chlorphenamine or dexamethasone is recommended. When antihistamines are used, give 10 mg to dogs <10 kg, 20 mg to dogs 10-30 kg, and 30 mg to dogs >30 kg, or give 0.5 mg/kg dexamethasone. Doxorubicin is highly irritant and must be administered via a preplaced i.v. catheter. The reconstituted drug should be administered over a minimum period of 10 min into the side port of a freely running i.v. infusion of 0.9% NaCl. Do not use heparin flush. See Appendix for conversion of body weight to surface area (m²). See specialist texts for protocols and further advice.

**Safety and handling:** This is a potent cytotoxic drug that should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. Personnel must be protected with suitable clothing, gloves, mask and eye shield. In the event of contact with skin or eyes, the affected area should be washed with copious amounts of water or normal saline. Medical advice should be sought if the eyes are affected. Pregnant women should not come into contact with the drug. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care. After reconstitution the drug is stable for at least 48h at 4°C. A 1.5% loss of potency may occur after 1 month at 4°C but there is no loss of potency when frozen at -20°C. Filtering through a 0.22 µm filter will ensure adequate sterility of the thawed solution.

**Contraindications:** Do not use in patients with existing cardiac disease, and only with care in breeds predisposed to cardiomyopathy. Use with caution in patients with liver disease, dose reduction may be required. Use with caution in patients previously treated with radiation as can cause radiation recall.
Adverse reactions: Allergic reactions to the drug have been reported; acute anaphylactic reactions should be treated with adrenaline, steroids and fluids. Doxorubicin causes a dose-dependent cumulative cardiotoxicity in dogs (dilated cardiomyopathy and congestive heart failure). It may also cause tachycardia and arrhythmias on administration; monitor with ECG and/or echocardiograms. Anorexia, vomiting, severe leucopenia, thrombocytopenia, haemorrhagic gastroenteritis and nephrotoxicity (in cats if dosages exceed 100 mg/m²) are the major adverse effects. A CBC and platelet count should be monitored whenever therapy is given. If the neutrophil count drops below 2 x 10⁹/l or if the platelet count drops below 50 x 10⁹/l, treatment should be suspended. Once the counts have stabilized, doxorubicin can then be restarted at the same dose. If haematological toxicity occurs again, or if GI toxicity is recurrent the dose should be reduced to 20 mg/m².

Drug interactions: Barbiturates increase plasma clearance of doxorubicin. Concurrent administration with cyclophosphamide increases the risk of nephrotoxicity in cats. The agent causes a reduction in serum digoxin levels. Do not mix doxorubicin with other drugs. Doxorubicin is incompatible with dexamethasone, 5-fluorouracil and heparin; concurrent use will lead to precipitate formation.

DOSES

**Dogs:** 30 mg/m² i.v. q3w, or 10 mg/m² on days 1, 2 and 3 every 4 weeks. Maximum total dose not to exceed 240 mg/m².

**Cats:** 20-25 mg/m² i.v. q3-5w for a maximum of 5 doses.

**Small mammals:** Ferrets: 20 mg/m² or 1-2 mg/kg i.v. every 3 weeks for a maximum of 5 doses. Also used for 2 doses as part of specific multi-drug protocols for lymphoma in ferrets. See relevant specialist texts.

**Birds, Reptiles:** No information available.

**Doxycycline** (Doxysceptin 300, Ornicate, Pulmodox, Ronaxan, Vibramycin*, Vibravenos*) POM-V

**Formulations:** Oral: 20 mg, 100 mg tablets (Ronaxan), 300 mg tablets (Doxysceptin); 260 mg/sachet powder (Ornicate). Injectable: 20 mg/ml long acting injection (Vibravenos; import on an STC).

**Action:** Bacteriostatic agent inhibiting protein synthesis at the initiation step by interacting with the 30S ribosomal subunit.

**Use:** Antibacterial (including spirochaetes such as Helicobacter spp. and Campylobacter spp.), antirickettsial (e.g. Mycoplasma haemofelis), antimycoplasmal and antichlamydial activity. It is the drug of choice to treat avian chlamydophilosis. It is not affected by, and does not affect, renal function as it is excreted in faeces, and is therefore recommended when tetracyclines are indicated in animals with renal impairment. It is preferred by some authors to oxytetracycline for use in birds. Being extremely lipid-soluble, it
penetrates well into prostatic fluid and bronchial secretions. Administer with food. Injection is very irritant in birds – must alternate injection sites or divide dose if large volume to inject.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer Doxyseptin to dogs <15 kg. Do not administer to pregnant animals. Do not administer if evidence of oesophagitis or dysphagia.

**Adverse reactions:** Nausea, vomiting and diarrhoea. Oesophagitis and oesophageal ulceration may develop; administer with food or a water bolus to reduce this risk. Administration during tooth development may lead to discoloration of the teeth, although the risk is less than with other tetracyclines.

**Drug interactions:** Absorption of doxycycline is reduced by antacids, calcium, magnesium and iron salts, and sucralfate, although the effect is less marked than seen with water-soluble tetracyclines. Phenobarbital, phenytoin and primidone may increase its metabolism, thus decreasing plasma levels. Do not use in combination with bactericidal antimicrobials.

**DOSES**

**Dogs, Cats:** 10 mg/kg p.o. q24h with food.

**Small mammals:** Rabbits: 2.5-4 mg/kg p.o. q24h; Rats, Mice: 5 mg/kg p.o. q12h; Other rodents: 2.5 mg/kg p.o. q12h.

**Birds:** Parrots: 15-50 mg/kg p.o. q24h, 1000 mg/kg in soft food/dehulled seed, 75-100 mg/kg i.m. q7d (Vibravenos; lower dose rate for macaws); course of treatment with doxycycline for chlamydophilosis = 45 days; Raptors: 50 mg/kg p.o. q12h, 100 mg/kg i.m. q7d (Vibravenos); Passerines/Pigeons: 40 mg/kg p.o. 12-24h, 200-500 mg/l in water (soft water only).

**Reptiles:** 50 mg/kg i.m. once, then 25 mg/kg i.m. q72h.

**Edetate calcium disodium (CaEDTA) (Ledclair®) POM**

**Formulations:** Injectable: 200 mg/ml solution.

**Action:** Heavy metal chelating agent.

**Use:** Lead and zinc poisoning. Dilute strong solution to a concentration of 10 mg/ml in 5% dextrose before use. Blood lead levels may be confusing, therefore monitor clinical signs during therapy. Measure blood lead levels 2-3 weeks after completion of treatment in order to determine whether a second course is required or if the animal is still being exposed to lead.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Reversible nephrotoxicity is usually preceded by other clinical signs of toxicity (e.g. depression, vomiting, diarrhoea). Dogs showing GI effects may benefit from zinc supplementation. Injections are painful.
Drug interactions: No information available.

DOSES

**Dog, Cats:** 25 mg/kg s.c. q6h for 2-5 days. The total daily dose should not exceed 2 g. Dogs that respond slowly or have an initial (pre-treatment) blood lead level of >4.5 µmol/l may need another 5-day course of treatment after a rest period of 5 days.

**Small mammals:** Ferrets: 20-30 mg/kg s.c q12h; Rabbits: 27.5 mg/kg s.c. q6h for 5 days; Rodents: 25-30 mg/kg s.c. q6-12h.

**Birds:** 35-50 mg/kg i.m., s.c. q12h for 5 days followed by 2 days of no treatment, then repeat until metal particles are no longer visible on radiographs. 100 mg/kg i.m. weekly has been proposed in zinc toxicosis.

**Reptiles:** 10-40 mg/kg i.m. q12h.

---

**Edrophonium** (Camsilon*, Reversol*, Tensilon*) POM

**Formulations:** Injectable: 10 mg/ml solution.

**Action:** Edrophonium is a rapid- and short-acting anticholinesterase prolonging the action of acetylcholine.

**Use:** Used in the diagnosis of myasthenia gravis, to treat atrial tachycardia (vagal effects) and to antagonize non-depolarizing neuromuscular blockade. Also used to distinguish between under- and over-treatment of myasthenia gravis with other anticholinesterases by giving doses at the lower end of the range for diagnostic tests. If treatment has been inadequate, edrophonium will produce an immediate amelioration of clinical signs, whereas in cholinergic crises due to over-treatment the signs will be temporarily aggravated.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Include nausea, vomiting, increased salivation and diarrhoea. Overdosage may lead to muscle fasciculations and paralysis. Severe bradycardia, even asystole, may occur if edrophonium is used to antagonize neuromuscular block without the co-injection of atropine.

**Drug interactions:** No information available.

**DOSES**

**Dogs:**
- Diagnosis of myasthenia gravis: 0.11-0.22 mg/kg i.v. (maximum of 5 mg). Improvement should be noted within 30 seconds, with the effects dissipating within 5 min, for a positive test. Atropine should be available (0.05 mg/kg) to control cholinergic side effects (e.g. salivation, urination).
- Atrial tachycardia after failure of vagal manoeuvres: 1.5 mg i.v. once (Note: This procedure is not advised in cases of heart failure).
• Antagonism of non-depolarizing neuromuscular blockade: edrophonium (0.5-1.0 mg/kg) is mixed with atropine (0.04 mg/kg) and injected i.v. over 2 min once signs of spontaneous recovery from block, e.g. diaphragmatic ‘twitching’ are present. Continued ventilatory support should be provided until full respiratory muscle activity is restored.

Cats:
• Diagnosis of myasthenia gravis: 2.5 mg/cat i.v. Improvement should be noted within 30 seconds, with the effects dissipating within 5 min, for a positive test. Atropine should be available (0.04 mg/kg) to control cholinergic side effects (e.g. salivation, urination).
• Atrial tachycardia after failure of vagal manoeuvres: doses as for dogs.

Small mammals, Birds, Reptiles: No information available.

Emodepside (Profendor) POM-V
Formulations: Topical: 21.4 mg/ml emodepside + 85.8 mg/ml praziquantel solution in spot-on pippettes.
Action: Stimulates presynaptic secretin receptors resulting in paralysis and death of the parasite.
Use: Treatment of roundworms (adult and immature) and tapeworms (adult) including Toxocara cati, Toxascaris leonina, Ancylostoma tubaeforme, Dipylidium caninum, Taenia taeniaeformis, Echinococcus multilocularis. Do not shampoo until substance has dried.
Safety and handling: Women of child-bearing age should avoid contact with this drug or wear disposable gloves when using it.
Contraindications: Not for use in cats <8 weeks or <0.5 kg. Possible interaction with P-glycoprotein substrates/inhibitors. Do not use in rabbits. Harmful to aquatic animals.
Adverse reactions: Ingestion may result in salivation or vomiting.
Drug interactions: No information available.
DOSES
Dogs: No information available.
Cats: Minimum dose 0.14 ml/kg applied topically once per treatment cycle.
Small mammals: Rabbits: Do not use.
Birds, Reptiles: No information available.

Enalapril (Enacard) POM-V
Formulations: Oral: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg tablets.
Action: Inhibits conversion of angiotensin I to angiotensin II, resulting in veno- and arteriodilation and decreased salt and water retention (reduced aldosterone production). In the kidney, due to efferent
arteriolar dilation resulting in a reduced glomerular filtration pressure, proteinuria may be reduced.

**Use:** Treatment of congestive heart failure and hypertension. It may reduce proteinuria in patients with diabetes mellitus, hypertension and protein-losing nephropathy (PLN). Often used in conjunction with diuretics and other drugs in cases of heart failure. Less potent in reducing blood pressure compared with amlodipine in cats but sometimes used together as antihypertensives.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** The dose of enalapril may need to be reduced in patients with renal dysfunction; monitor renal function after starting treatment. Hypersensitivity reactions, e.g. angioneurotic oedema, have been reported in humans.

**Adverse reactions:** Hypotension, renal impairment, hyperkalaemia, anorexia, vomiting and diarrhoea are the main adverse effects. Hypotension is the main concern if an overdose is given. Treat with normal saline to expand blood volume and support the blood pressure. Serum biochemical abnormalities reported in humans include hyperkalaemia, hyponatraemia, and increased liver enzymes and bilirubin.

**Drug interactions:** Concomitant treatment with NSAIDs, potassium-sparing diuretics and potassium supplementation may increase the risk of hyperkalaemia developing. The concurrent use of diuretics or vasodilators with enalapril may cause hypotension.

**DOSES**

**Dogs:**
- Cardiac disease, protein-losing nephropathy: 0.25-1 mg/kg p.o. q12-24h.
- Hypertension: Doses up to 3 mg/kg are recommended.

**Cats:** Cardiac disease, protein-losing nephropathy: 0.25 mg/kg p.o. q12-24h.

**Small mammals:** Ferrets: 0.25-0.5 mg/kg p.o. q24-48h; Rabbits: 0.25-0.5 mg/kg p.o. q24-48h.

**Birds:** 0.5-5 mg/kg p.o. q24h until signs resolve, then maintain on 0.5-1 mg/kg p.o. q24h.

**Reptiles:** No information available.

**Enilconazole** (Imaverol) POM-VPS

**Formulations:** Topical: 100 mg/ml (10%) liquid.

**Action:** Inhibition of cytochrome P450-dependent synthesis of ergosterol in fungal cells, causing increased cell wall permeability and allowing leakage of cellular contents.

**Use:** Fungal infections of the skin and nasal aspergillosis.

**Safety and handling:** Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: Hepatotoxic if swallowed.
Drug interactions: No information available.

DOSES
Dogs:
- Dermatological indications: Dilute 1 volume enilconazole in 50 volumes of water to produce a 0.2 mg/ml (0.2%) solution. Apply every 3 days for 3-4 applications.
- Nasal aspergillosis: 10 mg/kg q12h instilled into the nasal cavities and sinuses through indwelling tubes for 7-10 days. Dilute the solution of enilconazole (100 mg/ml) 50:50 with water. The instilled volume should be kept low (<10 ml) to reduce the risk of inhalation and the tubes flushed with an equivalent volume of air. Make up a fresh solution as required.

Cats: Dermatological indications: doses as for dogs.

Small mammals: No information available.

Birds: Dilute 1 volume of 10% solution with 10 volumes of water and give 0.5 ml/kg/day intratracheally for 7-14 days.

Reptiles: Apply topically to lesions correctly diluted (1:50 volume enilconazole to 50 volumes water) q48-72h.

Enrofloxacin (Baytril) POM-V
Formulations: Injectable: 25 mg/ml, 50 mg/ml, 100 mg/ml solutions. Oral: 15 mg, 50 mg, 150 mg tablets; 25 mg/ml solution.

Action: Enrofloxacin is a bactericidal antimicrobial which inhibits bacterial DNA gyrase. The bactericidal action is concentration-dependent, meaning that ‘pulse’ dosing regimens may be effective, particularly against Gram-negative bacteria.

Use: Active against *Mycoplasma* spp. and many Gram-positive and Gram-negative organisms, including *Pasteurella* spp., *Staphylococcus* spp., *Pseudomonas aeruginosa*, *Klebsiella* spp., *Escherichia coli*, *Mycobacterium* spp., *Proteus* spp. and *Salmonella* spp. Relatively ineffective against obligate anaerobes. Fluoroquinolones are highly lipophilic drugs that attain high concentrations within cells in many tissues and are particularly effective in the management of soft tissue, urogenital (including prostatic) and skin infections. For the treatment of non-tubercular mycobacterial disease, enrofloxacin can be combined with clarithromycin and rifampin. Administration by i.v. route is not authorized but has been used in cases of severe sepsis. If this route is used, administer slowly as the carrier contains potassium. Dilute solution for injection 1 in 4 with water if dosing small mammals orally. Switch to oral medications in birds as soon as possible.

Safety and handling: Normal precautions should be observed.
**Contraindications:** Fluoroquinolones are relatively contraindicated in growing dogs and rabbits, as cartilage abnormalities have been reported in young dogs and rabbits (but not cats). Enrofloxacin is not authorized in cats <8 weeks of age; dogs <1 year of age; large-breed dogs <18 months of age.

**Adverse reactions:** In birds, joint lesions have been induced in nestling pigeons with high doses of enrofloxacin, and muscle necrosis may be seen following i.m. administration. Enrofloxacin should be used with caution in epileptics until further information is available, as in humans they potentiate CNS adverse effects when administered concurrently with NSAIDs. In cats, retinal blindness has occurred and the higher the dose the greater the risk of this being irreversible.

**Drug interactions:** Adsorbents and antacids containing cations (Mg$^{2+}$, Al$^{3+}$) may bind to fluoroquinolones and prevent their absorption from the GI tract. The absorption of fluoroquinolones may also be inhibited by sucralfate and zinc salts; separate doses of these drugs by at least 2 hours. Fluoroquinolones increase plasma theophylline concentrations. Cimetidine may reduce the clearance of fluoroquinolones and so should be used with caution in combination with these drugs.

**DOSES**

**Dogs, Cats:** 5 mg/kg s.c., i.v. q24h; 2.5 mg/kg p.o. q12h or 5 mg/kg p.o. q24h. Some isolates of *Pseudomonas aeruginosa* may require higher doses, contact the manufacturer to discuss individual cases.

**Small mammals:** Ferrets: 5-10 mg/kg p.o., s.c., i.m. q12h or 10-20 mg/kg p.o., s.c., i.m. q24h; Rabbits: 5-10 mg/kg s.c., p.o., i.v. q12h or 20 mg/kg s.c., p.o., i.v. q24h or 100-200 mg/l drinking water; Rodents: 5-10 mg/kg s.c., p.o. q12-24h; Others: 5-10 mg/kg s.c., p.o. q12h or 20 mg/kg s.c., p.o. q24h.

**Birds:** 10-15 mg/kg i.m. (but see note above), p.o. q12h (sensitive infections can be treated q24h) or 100-200 mg/l drinking water.

**Reptiles:** 5-10 mg/kg i.m., p.o. q24-48h.

**Ephedrine** see page 405

**Epinephrine** see Adrenaline

**Epirubicin** (*4'-Epi-doxorubicin*) (*Epirubicin*, *Pharmorubicin*)

**POM**

**Formulations:** Injectable: 10 mg, 20 mg, 50 mg powder for reconstitution; 2 mg/ml solution.

**Action:** Intracellularly its metabolism results in production of cytotoxic free radicals. It also binds irreversibly to DNA, thereby preventing replication. It also alters membrane functions.

**Use:** Cytotoxic anthracycline glycoside antibiotic that has demonstrated efficacy against several human neoplasms. In the dog
the drug has only been assessed against lymphoma (similar efficacy to doxorubicin). It may be used alone or in combination with other antineoplastic therapies. The drug must be given i.v. Premedication with i.v. diphenhydramine, chlorphenamine or dexamethasone is recommended. When antihistamines are used, give 10 mg to dogs <10 kg, 20 mg to dogs 10-30 kg and 30 mg to dogs >30 kg, or give 0.5 mg/kg dexamethasone. As extravasation of the drug is likely to result in severe tissue necrosis, use of an indwelling catheter taped in place is recommended for administration. The reconstituted drug should be administered over a minimum period of 10 min into the side port of a freely running i.v. infusion of 0.9% NaCl. See Appendix for conversion of body weight to surface area (m²).

**Safety and handling:** This is a potent cytotoxic drug that should only be prepared and administered by trained personnel. Reconstitution or transfer to syringes or infusion bags should be carried out in designated areas, preferably a laminar flow cabinet. Personnel must be protected with suitable clothing, gloves, mask and eye shield. In the event of contact with skin or eyes, the affected area should be washed with copious amounts of water or normal saline. Medical advice should be sought if the eyes are affected. Pregnant women should be excluded from handling cytotoxic agents. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care. After reconstitution the drug is stable for 24h at room temperature (protect from light).

**Contraindications:** Reported to be less cardiotoxic than doxorubicin, epirubicin should still be used with caution in patients with or predisposed to cardiac disease.

**Adverse reactions:** Acute anaphylactic reactions should be treated with adrenaline, steroids and fluids. Epirubicin causes a dose-dependent cumulative cardiotoxicity in dogs (dilated cardiomyopathy and congestive heart failure) but possibly at a lower incidence than that of doxorubicin. This rarely develops in dogs given a total dose of <240 mg/m². It may also cause tachycardia and arrhythmias on administration. Dogs with pre-existing cardiac disease should be routinely monitored with ECGs and/or echocardiograms. Anorexia, vomiting, pancreatitis, severe leucopenia, thrombocytopenia, haemorrhagic gastroenteritis and nephrotoxicity are major adverse effects. A complete CBC and platelet count should be monitored whenever therapy is given. If the neutrophil count drops below 2 x 10⁹ or if the platelet count drops below 50 x 10⁹, treatment should be suspended. Once the counts have stabilized, epirubicin can then be restarted at the same dose. If haematological toxicity occurs again, or if GI toxicity is recurrent the dose should be reduced to 20 mg/m².

**Drug interactions:** Epirubicin is incompatible with heparin, a precipitate will form. Increased risk of myelosuppression when used in combination with cyclophosphamide. In humans cimetidine increased the area under the dose curve of epirubicin by 50% and should not be used concurrently.
DOSES

**Dogs:** 30 mg/m² i.v. q3wk; maximum total dose not to exceed 240 mg/m².

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Epoetin alfa, Epoetin beta** see Erythropoietin

**Equine chorionic gonadotrophin** see Serum gonadotrophin

---

**Erythromycin** (Erythrocin*, Erythromycin*, Erythroped*) POM

**Formulations:** Injectable: 200 mg/ml solution; 1 g/vial powder for reconstitution. Oral: 250 mg, 500 mg tablets/capsules; 25 mg/ml suspension; powder authorized for chickens.

**Action:** May be bactericidal (time-dependent) or bacteriostatic, depending upon drug concentration and bacterial susceptibility. It binds to the 50S ribosome, inhibiting peptide bond formation.

**Use:** Has a similar antibacterial spectrum to penicillins. It is active against Gram-positive cocci (some *Staphylococci* are resistant), Gram-positive bacilli and some Gram-negative bacilli (*Pasteurella* spp.). Some strains of *Actinomyces*, *Nocardia*, *Chlamydia* and *Rickettsia* are also inhibited by erythromycin. Most of the *Enterobacteriaceae* (*Pseudomonas* spp., *Escherichia coli*, *Klebsiella* spp.) are resistant. It is used in hamsters to treat proliferative ileitis (*Lawsonia intracellularis*) and in ferrets to control *Campylobacter* infection, although it may not eliminate intestinal carriage of this organism. Being a lipophilic weak base, it is concentrated in fluids that are more acidic than plasma, including milk, prostatic fluid and intracellular fluid. Resistance to erythromycin can be quite high, particularly in staphylococcal organisms. Erythromycin acts as a GI prokinetic by stimulating motilin receptors. Different esters of erythromycin are available. It is likely that the kinetics and possibly the toxicity will differ, depending on the ester used. Erythromycin’s activity is enhanced in an alkaline pH (pKa of erythromycin = 8.6). As the base is acid-labile it should be administered on an empty stomach.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** In humans the erythromycin estolate salt has been implicated in causing cholestatic hepatitis. Although not demonstrated in veterinary medicine, this salt should be avoided in animals with hepatic dysfunction. Erythromycin can cause enterotoxaemia in rodents.

**Adverse reactions:** The commonest adverse effect is GI upset. Care should be taken in cases of hepatic or renal impairment.

**Drug interactions:** Erythromycin may enhance the absorption of digoxin from the GI tract and increase serum levels of methylprednisolone, theophylline and terfenadine. The interaction with terfenadine proved particularly significant in human medicine, leading to fatal
Arrhythmias in some patients receiving both drugs. Erythromycin should not be used in combination with other macrolide, lincosamide or chloramphenicol antimicrobials as antagonism may occur.

**DOSES**

**Dogs, Cats:** 10-20 mg/kg p.o. q8-12h. GI prokinetic: 0.5-1 mg/kg p.o. q8h.

**Small mammals:** Ferrets: 10 mg/kg p.o. q6h; Hamsters: 20 mg/kg p.o. q12h or 0.13 mg/ml drinking water.

**Birds:** 20 mg/kg i.m., s.c. q8h; 60 mg/kg p.o. q12h or 125 mg/l of drinking water; 200 mg/kg soft feed.

**Reptiles:** No information available.

**Erythropoietin (Epoetin alfa, Epoetin beta) (Eprex*, Neorecormon*) POM**

**Formulations:** Injectable: 1000 IU, 2000 IU, 5000 IU powders for reconstitution; 2000 IU/ml, 4000 IU/ml, 10,000 IU/ml, 40,000 IU/ml solutions. Eprex is epoetin alfa. Neorecormon is epoetin beta.

**Action:** Stimulates division and differentiation of red blood cells.

**Use:** Recombinant human erythropoietin (r-HuEPO) is predominantly used to treat anaemia associated with chronic renal failure, although it is also used to treat anaemic human patients with cancer and rheumatoid arthritis, and cats with FeLV-associated anaemia. Erythropoietin is not indicated in conditions where high serum concentrations of the hormone already exist (e.g. haemolytic anaemia, anaemia due to blood loss), where the anaemia is due to iron deficiency or where systemic hypertension is present.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Conditions where high serum concentrations of erythropoietin already exist.

**Adverse reactions:** Local and systemic allergic reactions may rarely develop (skin rash at the injection site, pyrexia, arthralgia and mucocutaneous ulcers). The production of cross-reacting antibodies to r-HuEPO occurs in 20% of treated dogs and 30% of treated cats 4 weeks or more after treatment. These antibodies reduce the efficacy of the drug leading to a reappearance of the anaemia. The drug should be discontinued if this develops.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Epoetin beta: 50-100 IU/kg s.c. 3 times/week until PCV is normal, then gradually reduce frequency of dosing to maintain PCV at lower end of normal. Epoetin alfa: 50 IU/kg i.v. over 1-5 min 3 times/week. Once anaemia resolved, maintenance dose 75-300 IU/kg i.v. once weekly or divided doses.

**Small mammals:** Ferrets, Rabbits: epoetin alfa: 50-150 IU/kg i.m. q48h. Once desired PCV reached, administer q7d for maintenance.

**Bird, Reptiles:** No information available.
Esmolol (Brevibloc*) POM

Formulations: Injectable: 10 mg/ml solution.

Action: An ultra-short-acting beta-blocker. It is relatively cardioselective and blocks beta-1 adrenergic receptors in the heart. It has a negative inotropic and chronotropic action which can lead to a decreased myocardial oxygen demand. Blood pressure is reduced. It has an antiarrhythmic effect through its blockade of adrenergic stimulation of the heart.

Use: Therapy of, or as an assessment of the efficacy of beta-blockers in the treatment of, supraventricular tachycardias (including atrial fibrillation, atrial flutter and atrial tachycardia). Its effect is brief, persisting only 10-20 min after i.v. injection. Other beta-blockers must be used for chronic or maintenance therapy.

Safety and handling: Normal precautions should be observed.

Contraindications: Patients with supraventricular bradycardia and atrioventricular (AV) block, and relatively contraindicated in animals with congestive heart failure.

Adverse reactions: Most frequently seen in geriatric patients with chronic heart disease or in patients with rapidly decompensating cardiac failure. They include bradycardia, impaired AV conduction, myocardial depression, heart failure, syncope, glucose intolerance, bronchospasm, diarrhoea and peripheral vasoconstriction. Depression and lethargy are occasionally seen and are a result of esmolol’s high lipid solubility and penetration into the CNS. Esmolol may reduce the glomerular filtration rate and therefore exacerbate any pre-existing renal impairment.

Drug interactions: As the beta effects of sympathomimetics (e.g. adrenaline, phenylpropanolamine, terbutaline) may be blocked by esmolol, the unopposed alpha effects may result in severe hypertension and a decreased heart rate. The hypotensive effect of esmolol is enhanced by many agents that depress myocardial activity including anaesthetics, phenothiazines, antihypertensives, diuretics, diazepam and other antiarrhythmics. There is an increased risk of bradycardia, severe hypotension, heart failure and AV block if esmolol is used concurrently with calcium-channel blockers. Concurrent digoxin administration potentiates bradycardia. Esmolol may increase serum digoxin levels by up to 20%. Morphine may increase esmolol serum concentration by up to 50%. Esmolol may enhance the effects of muscle relaxants. The bronchodilatory effects of theophylline may be blocked by esmolol.

DOSES

Dogs, Cats: 0.05-0.1 mg/kg slow i.v. bolus every 5 min to a total cumulative dose of 0.5 mg/kg; 50-200 µg/kg/min constant rate infusion.

Small mammals, Birds, Reptiles: No information available.
**Estradiol** *(Oestradiol benzoate) (Mesalin) POM-V*

**Formulations:** Injectable: 0.2 mg/ml solution.

**Action:** Oestrogen administration interferes with the progesterone control of pregnancy and therefore creates a hostile uterine environment to continued pregnancy.

**Use:** Management of misalliance.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in cats.

**Adverse reactions:** Oestrogens may be toxic to bone marrow. The incidence of bone marrow aplasia is increased with higher doses, or chronic or repeated therapy.

**Drug interactions:** None known.

**DOSES**

**Dogs:** 0.01 mg/kg i.m., s.c. on day 3 and day 5 after mating. Administer a third dose on day 7 after mating where the exact date of mating is unclear or if the bitch was mated several times.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

**Estriol** *(Oestriol) (Incurin) POM-V*

**Formulations:** Oral: 1 mg tablet.

**Action:** Synthetic, short-acting oestrogen with a high affinity for oestrogen receptors in the lower urogenital tract. It increases muscle tone, improving urodynamic function.

**Use:** Management of urethral sphincter mechanism incompetence that develops in spayed bitches.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in intact bitches. Do not use if PU/PD present.

**Adverse reactions:** Oestrogenic effects are seen in 5-9% of bitches receiving 2 mg q24h.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** The dose has to be determined for each animal individually. Start at a dose of 1 mg/dog p.o. q24h. If treatment is successful reduce the dose to 0.5 mg/dog p.o. q24h. If treatment is unsuccessful increase to 2 mg/dog p.o. q24h. Alternate-day dosing can be considered once a response has been seen. The minimum effective dose is 0.5 mg/dog p.o. q24-48h. The maximum dose is 2 mg/dog p.o. q24h.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.
**Etamiphylline** (Millophylline V) POM-V  
**Formulations:** Oral: 100 mg, 200 mg, 300 mg tablets. Injectable: 140 mg/ml solution.  
**Action:** Phosphodiesterase inhibitor.  
**Use:** Bronchial constriction and pulmonary oedema. It has a mild diuretic action and is a mild cardiac and respiratory stimulant. It is recommended that the drug should not be used in animals <3 kg.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** No information available.  
**Adverse reactions:** Occasional CNS stimulation may develop; treat with a sedative (e.g. diazepam).  
**Drug interactions:** No information available.  
**DOSES**  
**Dogs:** dogs <10 kg: 70-140 mg/dog i.m., s.c. or 100 mg/dog p.o. q8h; 10-30 kg: 140-420 mg/dog i.m., s.c. or 100-300 mg/dog p.o. q8h; >30 kg: 420-700 mg/dog i.m., s.c. or 300-400 mg/dog p.o. q8h.  
**Cats:** 70-140 mg/cat i.m., s.c. or 100 mg/cat p.o. q8h.  
**Small mammals, Birds, Reptiles:** No information available.  

**Ethanol** (Alcohol*) POM  
**Formulations:** Injectable: 95% solution. To prepare a solution for i.v. use, dilute to 20% in sterile water and administer through a 22 µm filter.  
**Action:** Competitive inhibition of alcohol dehydrogenase.  
**Use:** Prevents metabolization of ethylene glycol (antifreeze) or methanol to toxic metabolites. Also used to cleanse and de-grease skin. When treating ethylene glycol toxicity, adjust dose to maintain blood ethanol levels above 35 mg/dl in dogs. Monitor fluid and electrolyte balance during ethanol therapy.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** No information available.  
**Adverse reactions:** Ethanol may cause additive depression and mask CNS signs of ethylene glycol toxicity, and cause diuresis.  
**Drug interactions:** No information available.  
**DOSES**  
**Dogs:** 5.5 ml of 20% ethanol solution/kg given i.v. q4h for 5 treatments, then i.v. q6h for 4 additional treatments. Alternatively, give an i.v. loading dose (rapidly infused over 15 min) of 1.4 ml/kg of 20% solution, then begin a constant infusion of 0.62 ml/kg/h, maintain for 48-56h.  
**Cats:** 5 ml of 20% ethanol solution/kg i.v. q6h for 5 treatments, then q8h for 4 additional treatments.  
**Small mammals, Birds, Reptiles:** No information available.
**Etherified starch** (eloHAES*, HAES-steril*, Hemohes*) POM

**Formulations:** Injectable: 6%, 10% solutions.

**Action:** Promotes retention of the fluid in the vascular system through the exertion of oncotic pressure.

**Use:** Expansion and maintenance of blood volume in various forms of shock including hypovolaemic, traumatic, haemorrhagic and septic shock. The duration of plasma expansion is prolonged (up to 24 h). Hetastarch administration increases plasma volume, generally by at least the volume administered but it can be up to 172%. Initial plasma expansion may be greater with pentastarch but the duration of action is shorter. In hypoalbuminaemic dogs the administration of hetastarch is associated with an increase in colloid osmotic pressure and a decrease in peripheral oedema. In humans the half-life of hetastarch varies with time after administration and dose, and administration of consecutive doses increases the half-life significantly. This dependence on time and dose has not been reported in dogs. In rabbits there is evidence that hetastarch may reduce postoperative adhesion formation.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution in animals with congestive heart failure or renal insufficiency as it increases the risk of circulatory overload. Etherified starch may interfere with serum biochemistry and cross-matching, thus blood samples should be collected prior to infusion. Etherified starch should not be used in animals with bleeding disorders.

**Adverse reactions:** Higher doses of hetastarch (20-30 ml/kg) have been associated with increases in bleeding time and the factor VIII complex is consistently decreased after hetastarch administration. No anaphylactoid reactions to hetastarch have been reported in cats and dogs (unlike humans).

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Hetastarch: 10-20 ml/kg/day i.v. infusion; maximum daily dose 1500 ml. Pentastarch: 10-40 ml/kg/day i.v. infusion; maximum daily dose 2000 ml.

**Small mammals:** Rabbits: Hetastarch: 20 ml/kg i.v. infusion.

**Birds, Reptiles:** No information available.

**Ethylestrenol** (Ethyoestrenol) (Nandoral) POM

**Formulations:** Oral: 0.5 mg tablet.

**Action:** Anabolic activity promotes electrolyte retention, protein repair and intracellular fluid retention.

**Use:** Ethylestrenol is a potent anabolic drug, derived from nandrolone and is a synthetic testosterone derivative. Used wherever excessive tissue breakdown or extensive repair processes are present. Although
authorized for use in renal failure, the use of this drug for this condition is controversial. Where possible the daily dosage should be divided and given at evenly spaced intervals. Normally a 10-14 day course is adequate, but in exceptional circumstances treatment may be prolonged.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Should not be given to pregnant animals.

**Adverse reactions:** Signs of virilism if unduly prolonged dosage or overdosages are administered. Monitor CBC to determine the efficacy of treatment and monitor liver enzymes. The drug may cause a strong urine odour in cats.

**Drug interactions:** Anabolic steroids may enhance the effects of warfarin. The insulin requirements of diabetics may decrease following the administration of anabolic steroids. The concurrent use of anabolic steroids with adrenal steroids may potentiate the development of oedema.

**DOSES**

**Dog, Cats:** 0.05 mg/kg p.o. q24h.

**Small mammals, Birds, Reptiles:** No information available.

---

**F3T** see Trifluorothymidine

---

**Famotidine** (Pepcid*) POM

**Formulations:** Oral: 20 mg, 40 mg tablets.

**Action:** Potent histamine (H2) receptor antagonist blocking histamine-induced gastric acid secretion. It is many times more potent than cimetidine, but has poorer oral bioavailability (37%).

**Use:** Management of gastric and duodenal ulcers, idiopathic, uraemic or drug-related erosive gastritis, oesophagitis, and hypersecretory conditions secondary to gastrinoma, mast cell neoplasia or short bowel syndrome. Reduction of vomiting due to gastric ulceration is typically achieved in about 2 weeks. However, animals should be treated for at least 2 weeks after the remission of clinical signs, so a minimum treatment duration of 28 days is recommended. Currently cimetidine is the only antiulcer drug with a veterinary market authorization.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In humans, famotidine has fewer side effects compared with cimetidine. There is little information on its use in dogs.

**Drug interactions:** Famotidine is devoid of many of the interactions of the H2 related antagonist cimetidine.
DOSES
*Dog, Cats:* 0.5-1.0 mg/kg p.o. q12-24h.
*Small mammals:* Ferrets: 0.25-0.5 mg/kg p.o., i.v., s.c. q24h.
*Birds, Reptiles:* No information available.

Febantel (Drontal plus, Drontal puppy) NFA-VPS

**Formulations:** Oral: 150 mg tablets containing febantel with praziquantel and pyrantel (Drontal plus); 15 mg/ml febantel with pyrantel suspension (Drontal puppy).

**Action:** Interferes with carbohydrate metabolism in the different developmental stages of helminths, including larvae in eggs.

**Use:** Prophylaxis and treatment of helminth infection, in combination with praziquantel and pyrantel.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use simultaneously with piperazine as this reduces efficacy. Do not use Drontal puppy in pregnant or lactating bitches as studies have not been carried out in these animals.

**Adverse reactions:** No information available

**Drug interactions:** Has a synergistic effect when used in combination with pyrantel.

**DOSES**

*Dogs:* 15 mg/kg p.o. once, repeated as required.

*Cats:* No information available.

*Small mammals, Birds, Reptiles:* No information available.

Feline facial fraction F3 (Feline facial pheromone F3, Familiarization pheromone) (Feliway) GSL

**Formulations:** Plug-in diffuser, topical environmental spray.

**Action:** Believed to provide a feeling of security for cats in unfamiliar or stressful situations. It is a synthetic analogue of the F3 fraction of the ‘feline facial pheromones’ which are used in facial marking of the physical environment by cats.

**Use:** Management of indoor urine marking, inappropriate scratching and changes to the animal’s physical environment at home or outside (e.g. during transport, within the cattery or the veterinary clinic). Additional indications include management of situational anxiety-related disorders. It can aid handling for anaesthesia induction and during other medical examinations when the spray may be applied to the consultation or preparation table. The diffuser should be placed in the room most frequently occupied by the cat and, in the case of management of behavioural disorders, where the inappropriate behaviour most frequently occurs.
Safety and handling: Normal precautions should be observed.

Contraindications: None, but as F3 depends on aerial diffusion for its activity, humans with known sensitivity to the ingredients should avoid using the product in their homes.

Adverse reactions: The pump spray should not mark or stain but it is sensible to patch test furniture, carpets, etc. before using extensively.

Drug interactions: None.

APPLICATION

Cats: Follow manufacturer’s instructions. Pump spray: F3 is applied to the environment in locations where the inappropriate behaviour is occurring and in locations that are of behavioural significance. When being used as a familiarization signal for cats in potentially stressful situations, or in new environments, the spray should be applied 30 min before the cat has access to the area. In the case of management of existing urine marking, one dose (one depression of the nozzle) should be applied daily from about 10 cm from the soiled site at a height of about 20 cm from the floor. In multicat households the spray should be applied 2-3 times/day on previously marked sites and once a day on other locations which are of behavioural significance. When using to prevent urine marking, spray once per day in locations of behavioural significance. For best results allow the spray to come to room temperature before it is applied and adjust cleaning regimes for indoor marking. Rinse well and allow areas to dry after cleaning, with biological washing powder followed by surgical spirit, before applying the F3 spray. The diffuser is active over an area of approximately 50-70 m². If the total target area exceeds this, a second diffuser should be used. One vial will last for approximately 4 weeks if the device is left switched on 24h per day. Do not repeatedly switch the diffuser on and off – it is designed to be left on at all times.

Dogs, Small mammals, Birds, Reptiles: Not applicable.

Feline facial fraction F4 (Feline facial pheromone F4) (Felipfriend) GSL

Formulations: Topical environmental spray.

Action: Believed to provide a feeling of security for cats in unfamiliar or stressful social situations. It is a synthetic analogue of the F4 fraction of the ‘feline facial pheromones’ which are used in facial marking of the social environment by cats.

Use: Used to familiarize cats to unfamiliar humans or those to whom they show apprehensive or fearful behaviour. The primary use is to improve tolerance of handling during veterinary examination and grooming. It may also be used to increase tolerance between cats but caution is warranted as it is not authorized for direct application to cats.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not spray close to the animal’s head, specifically in the region of the eyes.
Adverse reactions: In some cases a paradoxical increase in agitation and aggression is witnessed. If cats exhibit vocalization and threatening behaviour after the application, terminate the contact and attempt reintroduction slowly later. Stop if aggression continues.

Drug interactions: None.

APPLICATION

Cats: Follow manufacturer’s instructions. To aid familiarization to humans, apply 2 sprays of the solution to the palm of each hand and rub the hands and wrists together as required. Place the hands 20 cm in front of the cat’s nose and wait for one minute before attempting to initiate contact. For familiarization to cats, apply 2 sprays of the solution on to a compress and apply to the flank and neck regions of each cat. It is best to avoid using the pump spray in front of the cat since this can lead to fear responses. Wait for at least one minute after application before introducing the cats to each other and ensure that they are supervised.

Dogs, Small mammals, Birds, Reptiles: Not applicable.

Fenbendazole (Granofen, Panacur, Zerofen) NFA-VPS

Formulations: Oral: 222 mg/g granules (22%); 25 mg/ml (2.5%), 100 mg/ml (10%) suspensions; 0.187 g/g paste in a syringe; 500 mg, 1000 mg chewable tablets; 8 mg capsule (for pigeons).

Action: Inhibits fumarate reductase system of parasites thereby blocking the citric acid cycle and also reduces glucose absorption by the parasite.

Use: Treatment of ascarids (including larval stages), hookworms, whipworms, tapeworms (Taenia spp.), Oslerus osleri, Aelurostrongylus abstrusus, Angiostrongylus vasorum, Capillaria aerophila, Ollulanus tricuspis, Physaloptera rara and Paragonimus kellicotti infections. There is 60-70% efficacy against Dipylidium caninum. Fenbendazole has a 100% efficacy in clearing Giardia cysts. It is used in rabbits for the treatment of Encephalitozoon cuniculi. Unlike some other benzimidazoles, fenbendazole is safe to use in pregnant animals.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Bone marrow hypoplasia has been reported in a dog. Birds are more sensitive to adverse reactions. Pigeons and doves are susceptible to fenbendazole intoxication. Mortality of 50% has occurred at doses of 20 mg/kg p.o. given on 3 consecutive days. Vomiting, depression and death within 96 h are recorded in some raptors. Fenbendazole appears to affect bone marrow, intestinal and liver functions. Toxicity reported in birds at higher doses: blood dyscrasias, liver/gut damage, especially in vultures and storks, and in some raptors. Feather damage also reported in pigeons. Potential toxicity in some reptiles, e.g. ball pythons.

Drug interactions: No information available.
DOSES

**Dogs:**
- Roundworms, tapeworms: dogs <6 months old: 50 mg/kg p.o. q24h for 3 consecutive days; >6 months old, 100 mg/kg as a single dose p.o. Treatment of *Capillaria* may need to be extended to 10 days. Repeat q3months. For pregnant bitches 25 mg/kg p.o. q24h from day 40 until 2 days post-whelping (approximately 25 days).
- *Angiostrongylus vasorum, Oslerus osleri*: 50 mg/kg p.o. q24h for 7 days.
- Giardiasis: 50 mg/kg p.o. q24h for 3 days.

**Cats:**
- Roundworms, tapeworms: cats <6 months old: 20 mg/kg p.o. q24h for 5 days; >6 months old, 100 mg/kg as a single dose p.o.
- *Aelurostrongylus abstrusus*: 20 mg/kg p.o. q24h for 5 days.
- Giardiasis: 20 mg/kg p.o. for 5 days.

**Small mammals:**
- Rabbits: *E. cuniculi*: 20 mg/kg p.o. q24h for 28 days; Other small mammals: 20-50 mg/kg p.o. q24h for 5 consecutive days; the higher end of the range is suggested for giardiasis only.
- Birds:
  - Nematodes: 20-100 mg/kg p.o., administer 2 doses separated by 10 days; capillariasis: 25 mg/kg p.o. q24h for 5 consecutive days; Pigeons: 16 mg/kg p.o. once, repeat after 10 days if necessary or 10-20 mg/kg p.o. q24h for 3 days, repeat after 2 weeks; Passerines: 20 mg/kg p.o. q24h for 3 doses.
  - Giardiasis: 50 mg/kg p.o. q24h for 3 doses.
- Reptiles: Nematodes: 50-100 mg/kg once p.o., per cloaca; repeat after 2 and 4 weeks; *Giardia* and flagellates: 50 mg/kg p.o. q24h for 3-5 days. In species with potential toxicity, e.g. ball pythons (*Python regius*): 25 mg/kg p.o.

**Fentanyl** (Durogesic*, Fentanyl, Sublimaze, Fentora) POM CD

**Formulations:**
- Oral: 100 µg, 200 µg, 400 µg, 600 µg, 800 µg tablets.
- Injectable: 50 µg/ml solution. Transdermal: 12.5 µg/h, 25 µg/h, 50 µg/h, 75 µg/h, 100 µg/h patches.

**Action:** Synthetic pure OP3 agonist of the phenylpiperidine series.

**Use:** Very potent opioid analgesic (50 times more potent than morphine) used to provide profound intraoperative analgesia in dogs and cats. Can also be used at low dose rates for postoperative analgesia. Use of potent opioids during anaesthesia contributes to a balanced anaesthesia technique, therefore the dose of other concurrently administered anaesthetic agents should be reduced. See Sedative protocols in Appendix. Fentanyl has a rapid onset of action after i.v. administration and short duration of action.
(10-20 min depending on dose). After prolonged administration or high doses its duration of action is significantly prolonged as the tissues become saturated. It can be used intraoperatively to provide analgesia by intermittent bolus doses or by a continuous rate infusion. Intraoperative administration is likely to cause respiratory depression, therefore respiration should be monitored and facilities to provide positive pressure ventilation must be available. Postoperatively fentanyl can be given by continuous rate infusion to provide analgesia, doses at the low end of the dose range should be used and respiratory function monitored. Its clearance is similar to morphine whilst its elimination half-life is longer, reflecting its higher lipid solubility and volume of distribution. Transdermal fentanyl can be used to provide analgesia for up to 72 hours after surgery or for the management of chronic pain. Following transdermal application it takes approximately 7 hours in cats and 24 hours in dogs to attain adequate plasma concentrations to provide analgesia. Alternative forms of analgesia must be provided during this period, or patches must be placed before surgery. Systemic plasma concentrations of fentanyl can be very variable after transdermal absorption and some animals may not develop adequate plasma concentrations to achieve analgesia. Therefore, it is preferable to use transdermal fentanyl as an adjunctive analgesic in combination with other drugs. Direct application of heat sources to transdermal fentanyl patches (for example during anaesthesia) will significantly increase the uptake of fentanyl and may result in higher than expected plasma concentrations.

**Safety and handling:** If animals are sent home with transdermal fentanyl the owners must be warned about the dangers of patch ingestion by humans or other animals.

**Contraindications:** Animals with pre-existing respiratory compromise.

**Adverse reactions:** Rapid i.v. injection can cause severe bradycardia, even asystole, therefore the drug should be given slowly. A reduction in heart rate is likely whenever fentanyl is given, atropine can be administered to counter bradycardia if necessary.

**Drug interactions:** Fentanyl reduces the dose requirements of concurrently administered anaesthetics, including inhaled anaesthetics, by at least 50%.

**DOSES**

**Dogs:**

- **Intraoperative analgesia:** 1-5 µg/kg i.v.q20min.
- **Anaesthesia:** 2.5-10 µg/kg/h by continuous rate infusion during anaesthesia, reduced to 1-5 µg/kg/h during the postoperative period. Continuous rate infusions should be preceded by a loading dose (2-5 µg/kg).
- **Transdermal:** 4 µg/kg/h patch (e.g. 100 µg/h patch for a 25 kg dog).
**Cats:**
- Intraoperative analgesia: 5 µg/kg bolus, repeated injections may be required q20min.
- Anaesthesia: Continuous rate infusions as for dogs.
- Transdermal: 25 µg/h patch for cats 3-5 kg; in smaller cats and kittens the 12.5 µg/h patch can be applied.

**Small mammals, Birds, Reptiles:** No information available.

---

**Fentanyl/Fluanisone** (Hypnorm) POM-V CD Schedule 2

**Formulations:** Injectable: 0.2 mg/ml fentanyl with 10 mg/ml fluanisone.

**Action:** Fentanyl is a pure OP3 opioid agonist and fluanisone is a butyrophenone, the combination produces neuroleptanalgesia.

**Use:** Sedation and analgesia for restraint and to allow minor procedures to be carried out in mice, rats, rabbits and guinea pigs. Combined with a benzodiazepine it can be used to produce anaesthesia with muscle relaxation for surgery. It can be used for premedication prior to induction of anaesthesia with propofol in rabbits. Fentanyl/fluanisone produces a long duration of sedation and analgesia in small mammals (30-60 min), the duration of action is dependent on dose and varies between species. When used in combination with a benzodiazepine to produce anaesthesia, the dose of fentanyl/fluanisone should be reduced. Hypnorm is miscible with midazolam at appropriate dilutions, enabling a single injection to produce anaesthesia (see Sedative protocols in Appendix). Duration of anaesthesia is approximately 20-40 min, although recovery can be very prolonged. Various dose regimens for different species have been published. Prolonged respiratory depression in the recovery period can be avoided by the administration of a partial OP3 agonist (buprenorphine) at the end of the procedure. This will reverse respiratory depression induced by fentanyl and provide continued analgesia. Small mammals should be weighed before drug administration, accurate dosing is imperative to prevent overdose. Oxygen supplementation via a face mask is recommended during sedation/anaesthesia of all animals.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Animals with pre-existing respiratory compromise.

**Adverse reactions:** Respiratory depression can occur when given in high doses, particularly during the recovery period. Administration of buprenorphine in the recovery period can ameliorate respiratory depression and sedation, and provide ongoing analgesia. Measures should be taken to maintain normothermia during the sedation/anaesthesia and recovery period.

**Drug interactions:** No information available.
DOSES

**Dogs, Cats:** Not recommended.

**Small mammals:** Rabbits: 0.5 ml/kg i.m.; Guinea pigs: 1 ml/kg i.m.; Rats: 0.4 ml/kg i.m. or i.p.; Mice: 0.01/30 g i.p.

**Birds, Reptiles:** No information available.

---

**Filgrastim (G-CSF) (Neupogen*) POM**

**Formulations:** Injectable: 30 million IU (300 µg)/ml solution.

**Action:** Filgrastim is recombinant human granulocyte colony stimulating factor (rhG-CSF). It activates proliferation and differentiation of granulocyte progenitor cells, enhances granulopoiesis.

**Use:** In humans it is indicated in the management of neutropenia, especially in patients receiving high-dose chemotherapy. Neutrophil counts rise within 24 hours. Following discontinuation of therapy, neutrophil counts drop to normal after 5 days. There are few reports on the use of G-CSF in dogs or cats. It is most likely to be used in the management of febrile patients, particularly those receiving cytotoxic drugs with neutrophil counts <1x10^9/l. It may also be used as an adjunct in the treatment of infections, e.g. canine ehrlichiosis, parvovirus, FeLV or FIV, in the treatment of bone marrow neoplasia and for cyclic haemopoiesis in dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Concurrent administration with chemotherapy may increase incidence of adverse effects. G-CSF should be given at least 24 h after the last dose of chemotherapy as the stimulatory effects of G-CSF on haematopoietic precursors renders them more susceptible.

**Adverse reactions:** Normal dogs produce neutralizing antibodies to rhG-CSF. This limits repeated use and may result in neutropenia. This does not appear to be the case in canine chemotherapy patients. A variety of adverse effects have been reported in humans, including musculoskeletal pain, transient hypotension, dysuria, allergic reactions, proteinuria, haematuria and increased liver enzymes. Reported adverse effects are bone pain at high doses and irritation at the injection site.

**Drug interactions:** Steroids and lithium may potentiate the release of neutrophils during G-CSF therapy.

**DOSES**

**Dogs, Cats:** 500,000 IU (5 µg)/kg/day i.v. infusion, s.c., for 3-5 days.

**Small mammals, Birds, Reptiles:** No information available.
**Finasteride** (Proscar*) POM

**Formulations:** Oral: 5 mg tablet.

**Action:** Inhibits dihydrotestosterone (DHT) production within the prostate. DHT is the main hormonal stimulus for the development of benign prostatic hyperplasia.

**Use:** Treatment of benign prostatic hyperplasia as an alternative to castration.

**Safety and handling:** Women of child-bearing age should avoid handling crushed or broken tablets as finasteride is potentially teratogenic.

**Contraindications:** Do not use in breeding dogs as it is secreted into semen and causes fetal anomalies.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 5 mg per dog p.o. q24h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Fipronil** (Frontline, Frontline Combo) NFA-VPS

**Formulations:** Topical: 10% w/v fipronil spot-on pipettes in a wide range of sizes (Frontline) with S-methoprene (Frontline Combo). Also 0.25% w/v fipronil spray in alcohol base (Frontline spray) in a range of sizes.

**Action:** Interaction with ligand-gated (GABA) chloride channels blocking pre- and post-synaptic transfer of chloride ions, resulting in death of parasites on contact.

**Use:** Treatment and prevention of flea infestations (*Ctenocephalides*) and tick prevention in dogs and cats >8 weeks of age and >2 kg (dogs) or >1 kg (cats). Elimination of canine and feline biting lice (*Trichodectes canis, Felicola subrostratus*). For treatment of flea infestations the additional use of an approved IGR is recommended and the product should be applied every 4 weeks to all in contact cats and dogs. Minimum treatment interval 4 weeks. Frontline spray may be used in treating very young puppies with sarcoptic acariasis. Bathing 48 hours prior to and 24 hours after application is not recommended. Can be used in pregnant and lactating females.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Should not be used in rabbits. May be harmful to aquatic organisms

**Adverse reactions:** Local pruritus or alopecia may occur at the site of application.

**Drug interactions:** No information available.
DOSES

**Dogs:** Flea infestations: spray 3-6 ml/kg (6-12 pumps/kg 100 ml application, 2-4 pumps/kg 250 ml or 500 ml application) or apply 1 pipette per dog according to body weight. Treatment should be repeated not more frequently than every 4 weeks. Cheyletiellosis, Otocariasis (*Otodectes cyanotis*): spray 3-6 ml/kg (6-12 pumps/kg 100 ml application, 2-4 pumps/kg 250 ml or 500 ml application) or apply 1 pipette per dog according to body weight two applications 4 weeks apart. Treatment of the environment is also recommended.

**Cats:** Spray 3-6 ml/kg (6-12 pumps/kg 100 ml application) or apply 1 pipette per cat. Treatment should be repeated not more frequently than every 4 weeks.

**Small mammals:** Ferrets: spray 3-6 ml/kg q30-60d; Rodents: 7.5 mg/kg topically q30-60d.

**Birds:** Use spray form q30-60d. Apply to cotton wool and dab behind head, under wings and at base of tail (raptors/parrots) or lightly under each wing (pigeon/passerine).

**Reptiles:** Spray on to cloth first then wipe over surface of reptile q7-14d until negative for ectoparasites.

Firocoxib (Previcox) POM-V

**Formulations:** Oral: 57 mg, 227 mg tablets.

**Action:** NSAID that preferentially inhibits COX-2 enzyme thereby limiting the production of prostaglandins involved in inflammation. It has also has analgesic and antipyretic effects.

**Use:** Relief of pain and inflammation associated with osteoarthritis in dogs. Firocoxib is not authorized for preoperative administration to dogs. Liver disease will prolong the metabolism of firocoxib, leading to the potential for drug overdose with repeated dosing. Studies investigating the safety of firocoxib in dogs were only carried out for 90 days, therefore animals receiving firocoxib for more prolonged periods should be monitored carefully for NSAID-induced side effects.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer perioperatively until the animal is fully recovered from anaesthesia and normotensive. Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Administration of firocoxib to animals with renal disease must be carefully evaluated. Do not give to pregnant animals, animals <10 weeks old or <3 kg.

**Adverse reactions:** GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.
Drug interactions: Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES

Dogs: 5 mg/kg p.o. q24h, the tablets can be given with or without food. Cats: Do not use. Small mammals, Birds, Reptiles: No information available.

Flucloxacillin (Flucloxacillin*, Floxapen*) POM

Formulations: Injectable: Flucloxacillin sodium: 250 mg, 500 mg, 1 g powders for reconstitution. Oral: Flucloxacillin sodium: 250 mg or 500 mg capsules; powder for reconstitution with water giving a final concentration of 125 mg/5ml, 250 mg/5ml. Formulations of flucloxacillin with ampicillin are available (Co-fluampicil, Magnapen).

Action: Beta-lactamase-resistant, narrow spectrum beta-lactam antibiotic. It binds to penicillin-binding proteins, decreasing bacterial cell wall strength and rigidity, and affecting cell division, growth and septum formation. Flucloxacillin is bactericidal and works in a time-dependent fashion.

Use: Stable in gastric acid so can be given orally but food significantly reduces its bioavailability. It is less active than penicillin G or V against Streptococcus spp. and obligate anaerobic bacteria, and is indicated for the treatment of infections caused by beta-lactamase-producing Staphylococcus spp. Patients with significant renal or hepatic dysfunction may need dosage adjustment. 250 mg of flucloxacillin sodium contains 0.57 mEq of sodium. This may be clinically important for patients on restricted sodium intakes. Although flucloxacillin is absorbed from the GI tract, food has a significant inhibitory effect on its bioavailability; doses must be given on an empty stomach. As flucloxacillin kills in a time-dependent fashion, dosing regimens should be designed to maintain tissue concentrations above the MIC value throughout the interdosing interval.

Safety and handling: Normal precautions should be observed. Contraindications: Do not administer to hamsters, gerbils, guinea pigs, chinchillas or rabbits. Do not administer to animals with a history of sensitivity to beta-lactam antimicrobials. Use with care in hepatic disease or hepatic impairment.

Adverse reactions: Nausea, diarrhoea and skin rashes are the commonest adverse effects. Cholestatic hepatitis has been reported in humans.

Drug interactions: Avoid the concomitant use of bacteriostatic antibiotics. The aminoglycosides (e.g. gentamicin) may inactivate penicillins when mixed together in parenteral solutions. A synergistic effect is seen when beta-lactam and aminoglycoside antimicrobials are used concurrently.
DOSES

**Dogs, Cats:** Flucloxacillin sodium: 15 mg/kg i.v., i.m., p.o. q6h.
**Small mammals, Birds, Reptiles:** No information available.

**Fluconazole** (Diflucan*, Fluconazole*) POM-V

**Formulations:** Oral: 50 mg, 150 mg, 200 mg capsules; 40 mg/ml suspensions. Injectable: 2 mg/ml solution.

**Action:** Inhibition of the synthesis of ergosterol in fungal cell membranes, thus causing increased cell wall permeability and allowing leakage of cellular contents.

**Use:** Effective against *Blastomyces, Candida, Cryptococcus, Coccidioides, Histoplasma* and *Microsporum canis* infections and variably effective against *Aspergillus* and *Penicillium* infections. Fluconazole is authorized in the form of an oral solution for the treatment of *M. canis* dermatophytosis in cats. It attains therapeutic concentrations in the CNS and respiratory tract. It is excreted by the kidney, producing high concentrations in urine.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Reduce dose if renal impairment is present. Adverse effects may include nausea and diarrhoea. Do not use in cats with impaired liver function. Do not use in pregnant/lactating queens. May be hepatotoxic and cause vomiting in birds.

**Drug interactions:** Fluconazole (due to inhibition of cytochrome P450-dependent liver enzymes) may increase plasma theophylline concentrations. In humans, fluconazole has led to terfenadine toxicity when the two drugs were administered together. It may increase ciclosporin blood levels.

**DOSES**

**Dogs:** 2.5-5 mg/kg p.o. q12h.

**Cats:**
- Ocular/CNS cryptococcosis: 50 mg/cat i.v. infusion, p.o. q24h.
- Dermatophytosis, nasal cryptococcosis: 5 mg/kg p.o. q24h. For dermatophytosis administer for three periods of 7 days, with 7 days without treatment in between.

**Small mammals:** No information available.

**Birds:** 2-5 mg/kg p.o. q24h.

**Reptiles:** 5 mg/kg p.o. q24h (iguanas with dermatophytosis); 21 mg/kg loading dose then 10 mg/kg s.c q5d (Loggerhead turtles).
Flucytosine (Ancotil*) POM

Formulations: Injectable: 10 mg/ml solution.

Action: Fungal cells convert flucytosine (5-FC) into 5-fluorouracil (5-FU), which inhibits DNA and RNA synthesis in the cell. Mammalian cells are spared. Penetrates well into cerebrospinal fluid.

Use: Cryptococcosis (often in conjunction with amphotericin B or ketoconazole) particularly if involving meninges, systemic and urinary yeast infections (e.g. candidiasis). Little used in veterinary medicine compared with other antifungals.

Safety and handling: Normal precautions should be observed.

Contraindications: Use flucytosine with caution in patients with hepatic or renal impairment; reduce the dose and monitor haematological, renal and hepatic parameters.

Adverse reactions: Vomiting and diarrhoea may develop; alleviate by dosing over 15 min. Flucytosine may be teratogenic. Synergy with amphotericin B has been demonstrated, although there is an increased risk of nephrotoxicity. Drug eruptions, including toxic epidermal necrolysis.

Drug interactions: No information available.

DOSES

Dogs: 25-35 mg/kg i.v. q8h.

Cats: 25-50 mg/kg i.v. q6h.

Small mammals, Birds, Reptiles: No information available.

Fludrocortisone (Florinef*) POM

Formulations: Oral: 0.1 mg tablet.

Action: Aldosterone analogue that increases potassium excretion and sodium retention but which also has some glucocorticoid properties.

Use: Treatment of adrenocortical insufficiency (Addison’s disease).

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Hypertension, oedema (including cerebral oedema) and hypokalaemia with overdosages.

Drug interactions: Hypokalaemia may develop if fludrocortisone is administered concomitantly with amphotericin B or potassium-depleting diuretics (furosemide, thiazides).

DOSES

Dogs: Start at 0.01 mg/kg p.o. q24h depending on size of animal. Monitor sodium and potassium levels q1-2weeks and adjust dose by 0.05-0.1 mg accordingly. Most patients once stabilized will require approximately 0.1 mg/5 kg p.o. q24h. Supplemental doses may be required during times of stress.

Cats: Doses as for dogs (very few reports).

Small mammals, Birds, Reptiles: No information available.
Fluorometholone (FML*) POM

Formulations: Ophthalmic: 0.1% drops in 5 ml, 10 ml bottles.
Action: Phospholipase A2 inhibition (COX and lipoxygenase inhibition).
Use: Superficial ocular inflammation or anterior uveitis. However, it is now rarely used in veterinary ophthalmology.
Safety and handling: Normal precautions should be observed.
Contraindications: Corneal ulceration and infectious keratitis.
Adverse reactions: Topical corticosteroids can cause cataracts and glaucoma in humans. Although raised intraocular pressure associated with topical corticosteroids has been reported in dogs and cats, it is rarely important in the clinical setting. Steroid-induced cataracts have not been reported in small animals, although they have been documented in experimental cats. Systemic effects may be apparent with prolonged use.
Drug interactions: Concurrent use of topical NSAIDs with topical corticosteroids has been identified as a risk factor in humans for precipitating corneal problems.
DOSES
Dogs, Cats: 1 drop per eye q6-12h, although dose frequency is dependent on the severity of inflammation and response to therapy.
Small mammals, Birds, Reptiles: No information available.

Fluorouracil (5-FU) (Fluorouracil*, Efudix*) POM
Formulations: Injectable: 250 mg/vial, 500 mg/vial, 2500 mg/vial solutions.
Topical: 5% cream (Efudix).
Action: Metabolites of fluorouracil inhibit pyrimidine synthesis, resulting in inhibition of DNA synthesis and function.
Use: Treatment of basal cell and squamous cell carcinoma (topically), intestinal carcinoma, transitional carcinoma of the bladder and mammary carcinoma. See Appendix for conversion of body weight to surface area (m²). Consult relevant texts for specific protocols prior to use.
Safety and handling: Protective clothing should be worn to handle/administer the injectable solution or cream. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.
Contraindications: Do not use in cats as it causes seizures.
Adverse reactions: Anorexia, vomiting, stomatitis, diarrhoea, leucopenia with a nadir between 7 and 14 days, thrombocytopenia, anaemia, alopecia, hyperpigmentation, dermatitis, cerebellar ataxia and seizures.
**Drug interactions:** Cimetidine inhibits the metabolism of 5-FU. There is synergism between 5-FU and cisplatin as well as an increased risk of neurotoxicity. Methotrexate is synergistic if administered before 5-FU but is antagonistic if administered afterwards. Vincristine increases the cytotoxicity of 5-FU.

**DOSES**

**Dogs:** 75 mg/m² i.v. q24h for 5 days every 4-5 weeks, or 150-200 mg/m² i.v. once weekly for 6 weeks. In patients that have liver, renal or bone marrow impairment, reduce dose by half. Topical use: Apply to affected area q24h.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

**Fluoxetine (Reconcile*, Prozac*) POM**

**Formulations:** Oral: 8 mg, 16 mg, 20 mg, 32 mg, 64 mg tablets; 4 mg/ml liquid. Liquid formulation and some tablet sizes are available in the UK but not under veterinary authorization. Veterinary formulation not released in Europe at time of publication.

**Action:** Fluoxetine and its primary metabolite norfluoxetine block serotonin re-uptake in the brain, resulting in antidepressive activity and a raising in motor activity thresholds. It also has minor noradrenaline reuptake inhibition properties.

**Use:** Authorized in other countries for the management of canine separation anxiety in association with a behaviour modification plan, but more widely used for the management of compulsive disorders and some forms of aggression in dogs. Use in the latter indication should be with a specifically constructed behaviour modification plan and with caution. Fluoxetine may also be used in the cat to control urine spraying and other anxiety-related behaviour problems, such as psychogenic alopecia and certain forms of aggression, especially if not responsive to anxiolytic intervention. Similar precautions are warranted when used for aggression in cats as apply to its use in dogs. Has also been used to control feather-picking and other compulsive type behaviours in psittacines but relapse following the discontinuation of therapy is common.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Known sensitivity to fluoxetine or other SSRIs, history of seizures.

**Adverse reactions:** Common reactions include lethargy, decreased appetite and vomiting, which may result in minor weight loss. Trembling, restlessness and other GI disturbances may also occur and must be distinguished from a paradoxical increase in anxiety which has been reported in some cases. Owners should be warned of a potential increase in aggression in response to medication.

**Drug interactions:** Fluoxetine should not be used within 2 weeks of treatment with an MAOI, e.g. selegiline and an MAOI should not be
used within 6 weeks of treatment with fluoxetine. Fluoxetine, like other SSRIs, antagonizes the effects of anticonvulsants and so is not recommended for use with epileptic patients or in association with other agents which lower seizure threshold, e.g. phenothiazines. Caution is warranted if fluoxetine is used concomitantly with aspirin or other anticoagulants since the risk of increased bleeding in the case of tissue trauma may be increased.

**DOSES**

**Dogs:** 1-2 mg/kg p.o. q24h.  
**Cats:** 0.5-1.0 mg/kg p.o. q24h.  
**Small mammals:** No information available.  
**Birds:** 1 mg/kg p.o. q24h.  
**Reptiles:** No information available.

---

**Flurbiprofen** (*Ocufen*) POM  
**Formulations:** Ophthalmic: 0.3% solution in single-use vials.  
**Action:** Inhibits prostaglandin synthesis producing an anti-inflammatory and analgesic action. Prostaglandins also play a role in the mitotic response produced during intraocular surgery by constricting the iris sphincter independently of cholinergic mechanisms.  
**Use:** During cataract surgery. It is also useful for anterior uveitis and ulcerative keratitis when topical corticosteroids are contraindicated. Topical NSAIDs have the potential to increase intraocular pressure and should be used with caution in dogs predisposed to glaucoma.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** No information available.  
**Adverse reactions:** As with other topical NSAIDs, flurbiprofen may cause local irritation. Topical NSAIDs can be used in ulcerative keratitis but with caution as they can delay epithelial healing. Topical NSAIDs have been associated with an increased risk of corneal ‘melting’ (keratomalacia) in humans, although this has not been reported in the veterinary literature. Regular monitoring is advised.  
**Drug interactions:** Ophthalmic NSAIDs may be used safely with other ophthalmic pharmaceuticals, although concurrent use of drugs which adversely affect the corneal epithelium (e.g. gentamicin) may lead to increased corneal penetration of the NSAID. The concurrent use of topical NSAIDs with topical corticosteroids has been identified as a risk factor in humans for precipitating corneal problems.  

**DOSES**  
**Dog, Cats, Small mammals, Birds, Reptiles:** 1 drop per eye q6-12h depending on severity of inflammation. 1 drop q30min for 4 doses preoperatively (presurgery protocols vary widely).
Fluticasone (Flixotide*) POM

**Formulations:** Inhalational: 50 µg, 125 µg, 250 µg metered inhalations (Evohaler).

**Action:** Binds to specific nuclear receptors and affects gene transcription such that many aspects of inflammation are suppressed.

**Use:** Used as an inhaled corticosteroid in the management of inflammatory airway disease in dogs and cats. Administer via commercially available chambers and masks specifically designed for veterinary use.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Inhaled steroids are known to suppress the hypothalamic-pituitary-adrenal axis, although they are generally safer than systemic steroids.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 125-500 µg inhalations q12-24h.

**Cats:** 50-250 µg inhalations q12-24h.

**Small mammals, Birds, Reptiles:** No information available.

Fluvoxamine (Fluvoxamine*, Faverin*) POM

**Formulations:** Oral: 50 mg, 100 mg tablets.

**Action:** Serotonin uptake inhibitor that causes increased serotonin concentrations at the brain synapses with resultant anxiolytic, antidepressant and compulsive effects.

**Use:** Treatment of canine compulsive disorders, anxieties, phobias and panic attacks, especially when involving signs of impulsiveness and aggression. May be of use for the management of maternal aggression. In cats it has been suggested for use in a range of fears and anxieties and in the treatment of wool-eating. Plasma levels appear to increase in an exponential way with increased dosage. Only anecdotical reports of efficacy in the veterinary literature.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Known sensitivity to other selective serotonin reuptake inhibitors (SSRIs) such as fluoxetine. Fluvoxamine should not be used in pregnant and lactating animals or those with epilepsy, cardiovascular disease, diabetes mellitus, a history of bleeding disorder, or renal or hepatic compromise.

**Adverse reactions:** GI upset, inappetance, lethargy and vomiting may occur, resulting in minor weight loss. Occasional paradoxical signs of increased anxiety may be apparent. Tachycardia or bradycardia may develop.

**Drug interactions:** Fluvoxamine may be an inhibitor of cytochrome P450 3A4 and so should not be given in association with drugs.
metabolized by this cytochrome, such as alprazolam, cisapride and erythromycin. It is recommended not to administer fluvoxamine in combination with, or within 2 weeks of therapy with, monoamine oxidase inhibitors, e.g. selegiline.

**DOSES**

*Dogs*: 1-2 mg/kg p.o. q12h.

*Cats*: 1-4 mg/kg p.o. q24h

*Small mammals, Birds, Reptiles*: No information available.

**Fomepizole** *(4-Methylpyrazole) (Antizol®) POM*

**Formulations**: Injectable: 1 g/ml solution.

**Action**: Competitive inhibition of alcohol dehydrogenase.

**Use**: Treatment of ethylene glycol (antifreeze) toxicity in dogs. Available for import on a named-patient basis. Make required dose up in 100 ml normal saline for infusion. Not effective in cats.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: No information available.

**Adverse reactions**: No information available.

**Drug interactions**: No information available.

**DOSES**

*Dogs*: 20 mg/kg i.v. infusion of 30 min initially, then 15 mg/kg i.v. slowly over 15-30 min 12 h and 24 h later, then 5 mg/kg i.v. q12h until ethylene glycol concentration is negligible or the dog has recovered.

*Cats*: Not effective.

*Small mammals, Birds, Reptiles*: No information available.

**Framycetin** *(Canaural, Soframycin) POM-V POM*

**Formulations**: Topical: 5 mg/g suspension (Canaural, also contains fusidic acid, nystatin and prednisolone); 0.5% solution/ointment (Soframycin).

**Action**: Aminoglycosides inhibit bacterial protein synthesis and require an oxygen-rich environment to be effective, thus they are ineffective in low-oxygen sites (abscesses, exudates), making all obligate anaerobic bacteria resistant. They are bactericidal and their mechanism of killing is concentration-dependent, leading to a marked post-antibiotic effect, allowing pulse-dosing regimens which may limit toxicity.

**Use**: Treatment of ocular infections causing conjunctivitis or blepharitis, and aural infections. Framycetin is particularly effective against Gram-negative bacteria, although the combination preparation Canaural has a broad spectrum of activity.

**Safety and handling**: Normal precautions should be observed.
**Contraindications:** Do not use in animals with a perforated ear drum. Do not use in conjunction with other products known to be ototoxic.

**Adverse reactions:** Aminoglycosides are potentially ototoxic, and ataxia, deafness and nystagmus may be observed in cats where drops have been administered with a perforated ear drum. Local irritation.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Ophthalmic: 1-2 drops in the affected eye q8h (Soframycin), although dosing frequency may vary depending on the severity of the condition. Otic: 5-10 drops per ear q12h (Canaural).

**Small mammals, Birds, Reptiles:** No information available.

---

**Furosemide** *(Frusemide)* *(Dimazon, Fruscare, Frusedale)* POM

**Formulations:** Injectable: 50 mg/ml solution. Oral: 20 mg, 40 mg, 1 g tablets.

**Action:** Loop diuretic, inhibiting the reabsorption of chloride and sodium in the thick ascending limb of the loop of Henle. As a consequence it promotes natriuresis and reduces water resorption.

**Use:** Management of congestive cardiac failure, pulmonary oedema, non-cardiogenic ascites, hypercalcuric nephropathy, acute renal failure, uraemia, hyperkalaemia and hypertension. The use of chronic diuretic monotherapy in the management of cardiac failure should be avoided, as patients receiving diuretics alone may deteriorate more rapidly than those receiving other treatment modalities (usually ACE inhibitors) concurrently.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Presence of anuria, depleted electrolytes. A marked reduction in cardiac output can occur in animals with severe pulmonary disease, hypertrophic cardiomyopathy, pericardial or myocardial disorders, cardiac tamponade and severe hypertension. Do not use in dehydrated or hyperuricaemic birds.

**Adverse reactions:** Hypokalaemia, hypocalcaemia, hypomagnesaemia and hyponatraemia; dehydration occurs readily. Other adverse effects include ototoxicity, GI disturbances, leucopenia, anaemia, weakness and restlessness.

**Drug interactions:** Nephrotoxicity/ototoxicity associated with aminoglycosides may be potentiated when furosemide is also used. Furosemide may induce hypokalaemia, thereby increasing the risk of digoxin toxicity. Increased risk of hypokalaemia if furosemide given with acetazolamide, corticosteroids, thiazides and theophylline. The excretion of aspirin and furosemide may be reduced as they both compete for renal excretory sites; dose reduction may be required. Furosemide may inhibit the muscle relaxation qualities of tubocurarine, but increase the effects of suxamethonium.
DOSES

**Dogs:**

- Cardiogenic or pulmonary oedema: 1-2 mg/kg (may increase up to 4 mg/kg for acute short-term situations) i.v., i.m. q2-6h. Start on oral therapy once stabilized, at 2-4 mg/kg p.o. q8-12h. Maintenance doses are often 1-4 mg/kg p.o. q12h. Use the lowest dose necessary to control signs.
- Hypercalcuric nephropathy: hydrate before therapy. Give 5 mg/kg bolus i.v., then begin 5 mg/kg/h infusion. Maintain hydration status and electrolyte balance with normal saline and added KCl. Furosemide generally reduces serum calcium levels by 0.5-1.5 mmol/l.
- Acute renal failure/uraemia: after replacing fluid deficit give furosemide at 2 mg/kg i.v. If no diuresis within 1 hour repeat dose at 4 mg/kg i.v. If no response within 1 hour give another dose at 6 mg/kg i.v. The use of low-dose dopamine as adjunctive therapy is often recommended.
- To promote diuresis in hyperkalaemic states: 2 mg/kg i.v. q6h.

**Cats:**

- Cardiogenic or pulmonary oedema: use the lowest dose necessary to control signs, often 1-2 mg/kg q8-12h initially. Maintenance doses are often 0.5–2 mg/kg q8-24h.
- Other indications: doses as for dogs.

**Small mammals:**

**Rodents:** 1-4 mg/kg s.c., i.m. q4-6h or 5-10 mg/kg s.c., i.m. q12h.

**Birds:** 0.1-6.0 mg/kg i.m., s.c., i.v. q6-24h.

**Reptiles:** 5 mg/kg i.m. q12-24h.

**Fusidic acid** (Canaural, Fuciderm, Fucithalmic Vet) POM-V

**Formulations:** Topical: 5 mg/g fusidate suspension (Canaural also contains framycetin, nystatin and prednisolone); 0.5% fusidic acid + 0.1% betamethasone cream (Fuciderm); 1% fusidic acid viscous solution (Fucithalmic Vet).

**Action:** Inhibits bacterial protein synthesis.

**Use:** Active against Gram-positive bacteria, particularly *Staphylococcus intermedius*. It is used topically in the management of staphylococcal infections of the conjunctiva, skin or ear. Fusidic acid is able to penetrate skin and penetrate the cornea gaining access to the anterior chamber of the eye. The carbomer gel vehicle in the ocular preparation may also be efficacious as a surface lubricant.

**Safety and handling:** Avoid contamination of the container on application.

**Contraindications:** Do not use preparations containing corticosteroids in pregnant animals. Avoid preparations containing corticosteroids in birds.
**Adverse reactions**: No information available.

**Drug interactions**: No information available.

**DOSES**

**Dogs**:
- Otic: 5-10 drops per affected ear q12h.
- Ophthalmic: 1 drop per eye q12-24h.
- Skin: Apply to affected area q12h for 5 days.

**Cats**: Otic, Ophthalmic: doses as for dogs.

**Small mammals**: Rabbits: Fucithalmic Vet: 1 drop per eye q12-24h.

**Birds**:
- Skin: apply a thin layer q24h; Ophthalmic: 1 drop per affected eye q12-24h.
- **Reptiles**: No information available.

---

**Gabapentin** (*Gabapentinum*) (*Neurontin*) POM

**Formulations**: Oral: 100 mg, 300 mg, 400 mg capsules.

**Action**: The precise mechanism of action of gabapentin is unknown; however, it has been suggested that it increases the synaptic levels of GABA in the CNS, most likely through increased synthesis of GABA. Gabapentin has been demonstrated to decrease the influx of calcium ions into neurons via a specific subunit of voltage-dependent calcium channels. Gabapentin does not interact with sodium-dependent channels and demonstrates no affinity for the common neurotransmitter receptors, including benzodiazepine, glutamate, glycine and dopamine.

**Use**: Adjunctive therapy in the treatment of seizures refractory to treatment with phenobarbital and/or potassium bromide. Gabapentin has also been used in the treatment of neuropathic pain in adult dogs. Antiepileptics are among the drugs used to manage neuropathic pain in human patients, which is often insensitive to opioid analgesics. Gabapentin crosses the blood-brain barrier more readily than GABA, which is the major inhibitory neurotransmitter in the CNS. After multiple dosing, peak plasma concentrations of gabapentin are usually achieved within 2 hours of a dose and steady state achieved within 1 to 2 days. Gabapentin therapy should only be withdrawn slowly. Monitoring of serum levels in dogs and in human patients does not appear useful. In one study of dogs on doses of approximately 10 mg/kg q8h, serum levels of gabapentin after 3 months of therapy ranged from 2.2 to 20.7 mg/l.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Gabapentin should be used with caution in patients with renal impairment and behavioural abnormalities.

**Adverse reactions**: The most commonly reported adverse effect in dogs is mild sedation and ataxia. False-positive readings have been reported with some urinary protein tests in human patients taking gabapentin.
Drug interactions: The absorption of gabapentin from the GI tract is reduced by antacids containing aluminium with magnesium; it is recommended that gabapentin is taken at least 2 hours after the administration of such an antacid. Cimetidine has been reported to reduce the renal clearance of gabapentin but the product information does not consider this to be of clinical importance.

DOSES
Dogs: Approximately 10 mg/kg p.o. q8h (based on available capsule sizes).
Cats, Small mammals, Birds, Reptiles: No information available.

Gelatine (Oxypolygelatine) (Gelofusine Veterinary, Haemaccel)
POM-V
Formulations: Injectable: 40 g/l succinylated gelatine in saline (Gelofusine); 35 g/dl degraded urea-linked gelatine with NaCl, KCl, CaCl₂ (Haemaccel).
Action: Promotes retention of fluid in the vascular system through the exertion of oncotic pressure.
Use: The expansion and maintenance of blood volume in various forms of shock including hypovolaemic, traumatic, haemorrhagic and septic shock. The main advantages of gelatine-based solutions over other colloids is that they have lower molecular weights (and hence are excreted rapidly), appear to have few antigenic or anticoagulative effects. The plasma half-life of most gelatines is approximately 8 hours (oxypolygelatine 2-4 hours), so that the duration of plasma expansion is shorter than with etherified starch and dextrans.
Safety and handling: Normal precautions should be observed.
Contraindications: Use with caution in animals with congestive heart failure or renal insufficiency as they will increase the risk of circulatory overload.
Adverse reactions: Anaphylactoid reactions to gelatine solutions are rare; it is uncertain whether these reactions represent an immunological response or are due to histamine release. There appears to be little effect on coagulation or blood loss following gelatine administration.
Drug interactions: No information available.
DOSES
Dogs, Cats: Infuse a volume similar to the estimated blood loss. In normal circumstances do not exceed replacement of >25% of circulating blood volume with gelatines in a 24 h period.
Small mammals, Birds, Reptiles: No information available.
**Gentamicin** (Clinagel Vet, Tiacil, Pangram, Genticin*) POM-V, POM

**Formulations:** Injectable: 40 mg/ml solution for i.v., i.m., s.c. injection (human preparation), 50 mg/ml solution for i.m., s.c. injection (Pangram). Ophthalmic/aural solution: 0.3% solution (Tiacil); 0.3% ophthalmic gel (Clinagel). Gentamicin is a component of many topical ear preparations.

**Action:** Aminoglycosides inhibit bacterial protein synthesis and require an oxygen-rich environment to be effective, thus they are ineffective in low-oxygen sites (abscesses, exudates), making all obligate anaerobic bacteria resistant. They are bactericidal and their mechanism of killing is concentration-dependent, leading to a marked post-antibiotic effect, allowing pulse-dosing regimens which may limit toxicity.

**Use:** Active against Gram-negative bacteria, but some staphylococcal and streptococcal (*Streptococcus faecalis*) species are also sensitive. All obligate anaerobic bacteria and many haemolytic streptococci are resistant. Use in domestic animals is limited by nephrotoxicity and, more rarely, ototoxicity and neuromuscular blockade. Microbial resistance is a concern, although many bacteria resistant to gentamicin may be susceptible to amikacin. Monitoring serum gentamicin levels is recommended for those with pre-existing renal dysfunction if the use of this drug is considered essential. The trough serum level should be allowed to fall below 2 µg/ml. When used for ‘blind’ therapy of undiagnosed serious infections, gentamicin is usually given in conjunction with a penicillin and/or metronidazole. Aminoglycosides are more active in an alkaline environment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Geriatric animals or those with reduced renal function should only be given this drug systemically when absolutely necessary and then the interdosing interval should be 12 h or longer. Do not use the aural preparation if the ear drum is perforated. Do not use in conjunction with other drugs considered to be nephrotoxic.

**Adverse reactions:** Gentamicin delays epithelial healing of corneal ulcers and may cause local irritation. Nephrotoxicity and ototoxicity are potential side effects. Cellular casts in urine sediment are an early sign of impending nephrotoxicity; serum creatinine levels rise later. Use with caution in birds as it is toxic. Monitor uric acid levels in birds and reptiles. Gentamicin should not be used during pregnancy.

**Drug interactions:** Avoid the concurrent use of other nephrotoxic, ototoxic or neurotoxic agents (e.g. amphotericin B, cisplatin, furosemide). Increase monitoring and adjust dosages when these drugs must be used together. Aminoglycosides may be chemically inactivated by beta-lactam antibiotics (e.g. penicillins, cephalosporins) or heparin when mixed *in vitro*. The effect of non-depolarizing muscle relaxants (e.g. atracurium, pancuronium, vecuronium) may be enhanced by aminoglycosides. Synergism may occur when aminoglycosides are used with beta-lactam antimicrobials. Activity may be reduced if used in conjunction with bacteriostatic antimicrobials.
DOSES

Dogs, Cats:
- Otic: 2-4 drops in affected ear or apply ointment to affected area q6-8h.
- Ophthalmic: 1 drop per eye q6-8h. Severe ocular infections may require dosing q1-2h. A fortified topical solution (100 mg gentamicin in 5 ml of 0.3% solution, making 14.3 mg/ml) can be used.
- Systemic: 2-5 mg/kg i.v. (slowly over 30 min), i.m., s.c. q12h for 2 doses then q24h; there is evidence that 5-10 mg/kg i.v., i.m., s.c. q24h may be less nephrotoxic.

Small mammals:
- Ferrets: 2-4 mg/kg i.v. (over 30 min), i.m., s.c. q6-12h; topically q6-8h; Rabbits: 1.5-2.5 mg/kg s.c., i.m., i.v. q8h; Guinea pigs: 6 mg/kg s.c. q24h; Rats and Mice: 4-20 mg/kg i.m. q12h; Other rodents: 2-5 mg/kg s.c., i.m. q8-24h.
- Birds: 2-5 mg/kg i.v., i.m. q6-12h; topically q6-8h; nebulize 50 mg in 10 ml saline for 15 min q8-12h.
- Reptiles: Chelonians: 2-4 mg/kg i.m. q72h; may also be nebulized at dilution of 10-20 mg gentamicin/15 ml saline for 15-20 min q8-12h for respiratory tract infections in chelonians and lizards; Snakes: 2.5 mg/kg i.m. q72h.

Glibenclamide (Glibenclamide*) POM
Formulations: Oral: 2.5 mg, 5 mg tablets.
Action: Increases insulin secretion thereby reducing blood glucose.
Use: Management of diabetes mellitus only where some residual pancreatic beta-cell activity is present. Very few diabetic dogs are likely to respond, whereas many cats may respond. Adjust the dose until normoglycaemia is attained. Less well researched in cats when compared with glipizide.
Safety and handling: Normal precautions should be observed.
Contraindications: Do not use if ketoacidosis present or in cases with hepatic or renal impairment.
Adverse reactions: Hypoglycaemia and vomiting may develop.
Drug interactions: May be enhanced by ACE inhibitors, NSAIDs, chloramphenicol, potentiated sulphonamides and fluoroquinolones.

DOSES
Dogs: Do not use
Cats: 0.2 mg/kg p.o. q24h (no published reports on use).
Small mammals, Birds, Reptiles: No information available.
Glipizide (Glipizide*, Minodiab*) POM

Formulations: Oral: 2.5 mg, 5 mg tablets.

Action: Increases insulin secretion thereby reducing blood glucose.

Use: Management of type II non-insulin-dependent diabetes mellitus, where there is some residual insulin production. May be effective alone or administered with insulin to reduce insulin requirements. It is ineffective when there is an absolute insulin deficiency or when insulin resistance is present. An effect on blood glucose may not be seen for 4-8 weeks. Administer with food.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use if ketoacidosis present. Do not use if there is evidence of reduced hepatic or renal function.

Adverse reactions: Glipizide may cause GI disturbances (e.g. vomiting) and sensitivity reactions (e.g. jaundice, rashes, fever).

Drug interactions: The effects of glipizide may be enhanced by ACE inhibitors, NSAIDs, chloramphenicol, potentiated sulphonamides and fluoroquinolones.

DOSES

Dogs: Do not use.

Cats: 0.25-0.5 mg/kg p.o. q12h. Start at the lower end of the dose range, increasing the dose as required if no adverse effects are reported after 2 weeks.

Small mammals, Birds, Reptiles: No information available.

Glucose (Dextrose) (Aqupharm, Vetivex, 50% Glucose for injection) POM-V, POM-VPS, POM

Formulations: Injectable: sodium chloride 0.9% w/v, glucose monohydrate 5.5% w/v (Aqupharm No. 3 and Vetivex 3), sodium chloride 0.18% w/v, glucose monohydrate 4.4% w/v (Aqupharm No. 18 and Vetivex 6), other electrolyte solutions with glucose for i.v. use: Glucose 40% and 50% w/v.

Action: Source of energy for cellular metabolism.

Use: Dilute glucose solutions are used for fluid replacement (primarily where intracellular and interstitial losses have occurred). Concentrated glucose solutions are used parenterally as an energy source or in the treatment of hypoglycaemia. Patients requiring parenteral nutritional support will require mixtures comprising combinations of amino acids, glucose solutions and fat. See also Amino acid solutions and Lipid emulsions for use in parenteral nutrition. Solutions containing >5% glucose are hypertonic and irritant if given other than i.v. The 50% solutions contain 1.7 kcal/ml (8.4 kJ/ml) glucose and are extremely hypertonic (2525 mOsm/l).

Safety and handling: Multi-use vials of 5% glucose or higher rapidly support bacterial growth and strict aseptic technique is required, single patient use is advised.
**Contraindications:** Use with caution in patients with insulin resistance and diabetes mellitus.

**Adverse reactions:** 10-50% solutions are irritant and hyperosmolar; administer through a jugular catheter or dilute appropriately. Glucose infusions may produce severe hypophosphataemia. If glucose loading produces signs of hyperglycaemia, insulin may be added to correct it. See comments under Amino acid solutions for use in parenteral nutrition solutions.

**Drug interactions:** No information available.

**DOSES**

**Dogs:**
- Fluid therapy: Fluid requirements depend upon the degree of dehydration and ongoing losses. See Parenteral fluids table in Appendix.
- Parenteral nutrition: The amount required will be governed by the animal's physiological status, the parenteral nutrition admixture and its ability to tolerate high blood glucose levels. Generally glucose is used to supply 40-60% of the energy requirement. Seek specialist advice before giving parenteral nutrition. See Amino acid solutions.
- Hypoglycaemia: 1-5 ml 50% dextrose i.v. slowly over 10 min. Note that to meet minimum needs for maintenance 1 ml/kg/h of 50% glucose is needed.

**Cats:** Doses as for dogs for fluid therapy and hypoglycaemia. Specific advise regarding nutrient admixtures and the use of concentrated glucose solutions for provision of energy in cats requiring nutritional support should be sought.

**Small mammals, Birds, Reptiles:** No information available.

**Glycerol** (Glycerin(e)) (Glycerol*) GSL

**Formulations:** Oral: 50% glycerol solution.

**Action:** Lowers intraocular pressure by reducing aqueous humour production and improving aqueous humour outflow (secondary to reducing vitreous humour volume).

**Use:** Management of acute glaucoma and is helpful for emergency home use. It has been superceded by topical agents. Maximal reduction in intraocular pressure is seen approximately 1 hour after dosing and will last for approximately 10 hours. Glycerol is also used as a topical emollient and solvent, and as a laxative when given rectally in cats. Glycerol induces less diuresis than mannitol as it is readily metabolized.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Oral glycerol is contraindicated in diabetes mellitus, dehydration and suspected renal dysfunction. Renal function should be assessed before treatment as prerenal azotaemia or renal failure can result.
**Adverse reactions:** Nausea, vomiting and dehydration; weight gain if used over extended periods.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** Acute glaucoma: 1-2 g/kg p.o. as a single dose.

**Cats:**
- Acute glaucoma: 1-2 g/kg p.o. as a single dose.
- Laxative: 3 ml (100% solution) per rectum.

**Small mammals, Birds, Reptiles:** No information available.

**Glyceryl trinitrate (Nitroglycerin(e)) (Glyceryl trinitrate*, Nitrocine*, Percutol*, Sustac*) POM**

**Formulations:**
- Topical: 2% ointment to be applied to skin (Percutol).
- Oral: 2.6 mg, 6.4 mg modified-release tablets (Sustac). Injectable: 1 mg/ml, 5 mg/ml solutions (Glyceryl trinitrate, Nitrocine).

**Action:** Systemic vasodilator. Although a potent coronary vasodilator, its major benefit follows from a reduction in venous return as a consequence of venodilation. A decrease in venous return reduces left ventricular work.

**Use:** Short-term management of oedema (particularly acute pulmonary oedema) and to reduce ventricular filling pressures in animals with congestive cardiac failure. It is normally only used for 1-2 days. Its efficacy is debatable.

**Safety and handling:** Owners should be cautioned to avoid contact with areas where the ointment has been applied and to wear non-permeable gloves when applying.

**Contraindications:** Hypotension, hypovolaemia, head trauma.

**Adverse reactions:** Hypotension (reduce dose), tachycardia and a rash at the site of application (rotate application sites). Suggested sites include the thorax, groin or inside the ears. Rub ointment well into the skin. Tachyphylaxis can occur. Headaches are common in humans and may be an adverse effect in animals also.

**Drug interactions:** Concurrent use of ACE inhibitors, anaesthetics, beta-blockers, calcium-channel blockers, corticosteroids and diuretics may enhance the hypotensive effect. NSAIDs may antagonize its hypotensive effects.

**DOSES**

**Dogs:** 6-50 mm (1/4-2 inches) applied topically to the skin q6-8h; 5 µg/min i.v. infusion increasing in increments of 10-20 µg/min until an effect is reached; 2.6-6.4 mg p.o. q8-12h (modified-release tablets). Where it is used chronically for the management of heart failure (e.g. nocturnal dyspnoea) use q24h to avoid tolerance.

**Cats:** 3-6 mm (1/8-1/4 inches) topically to the skin q6-8h; 5 µg/min i.v. infusion increasing in increments of 10-20 µg/min until an effect is reached; 2.6 mg p.o. q8-12h (modified-release tablets).
Small mammals: Ferrets: 1/16 – 1/8 inches topically to the skin q12-24h.

Birds, Reptiles: No information available.

**Glycopyrronium** (Glycopyrrolate) (Robinul*) POM

**Formulations:** Injectable: 200 µg/ ml solution.

**Action:** Blocks the action of acetylcholine at muscarinic receptors at the terminal ends of the parasympathetic nervous system, reversing parasympathetic effects. Its quaternary structure prevents it from crossing the blood-brain barrier and so it is devoid of central effects.

**Use:** Potent antisialagogue agent and has been used preoperatively to decrease oral and bronchial secretions. It is also used to inhibit vagal efferent activity and manage bradycardias caused by the administration of potent opioid drugs. Glycopyrronium is used with long-acting anticholinesterase drugs (e.g. neostigmine, pyridostigmine) during antagonism of neuromuscular block. Glycopyrronium is longer acting than atropine. Routine administration of glycopyrronium prior to anaesthesia as part of premedication is no longer recommended. It causes a reduction in oral and bronchial secretions by decreasing the water content, therefore secretions become more sticky. Administration of potent opioids in the perioperative period can promote bradyarrhythmias but it is better to monitor heart rate and give glycopyrronium to manage a low heart rate if necessary. Administration of very low doses of glycopyrronium i.v. can cause exacerbation of bradydysrhythmias due to a vagal stimulatory effect; giving another dose i.v. will usually cause an increase in heart rate. Glycopyrronium is devoid of central effects and therefore does not cause mydriasis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Combining glycopyrronium and alpha-2 agonists is not recommended.

**Adverse reactions:** Tachycardias following overdose of glycopyrronium are usually transient and do not require management. Ventricular arrhythmias may be treated with lidocaine if severe. The incidence of adverse effects is lower than that seen with atropine.

**Drug interactions:** When mixed with alkaline drugs (e.g. barbiturates) a precipitate may form. Antimuscarinics may enhance the actions of sympathomimetics and thiazide diuretics. The following may enhance the activity of glycopyrronium: antihistamines, procainamide, quinidine, pethidine, benzodiazepines and phenothiazines.

**DOSES**

**Dogs, Cats:**
- Premedication: 2-10 µg/kg i.v.,i.m. 10-15 min prior to anaesthetic induction.
Neuromuscular blockade antagonism: glycopyrronium (10 µg/kg i.v. once) with neostigmine (50 µg/kg i.v. once).

**Small mammals:** Rabbits: 11 µg/kg i.v., i.m. once; Rodents: 10-20 µg/kg i.v., i.m. once.

**Birds:** Premedication: 10-30 µg/kg i.m., i.v. once.

**Reptiles:** 10 µg/kg i.m., i.v.

**Growth hormone** see Somatotropin

**Haemoglobin glutamer** (Oxyglobin) POM-V

**Formulations:** Injectable: 130 mg/ml solution in a 125 ml oxygen-impermeable delivery bag.

**Action:** An ultrapurified, polymerized haemoglobin of bovine origin in modified Ringer’s lactate solution which can carry oxygen.

**Use:** Provides oxygen-carrying capacity for anaemic dogs. It has an intravascular half-life of 30-40 h in healthy dogs. Because there is no red cell membrane, pre-treatment compatibility testing is not required. The effect of repeated dosing is unknown. It is isosmotic to blood and has a lower viscosity. The product is not authorized for use in cats but has been used, albeit given at a slower rate.

**Safety and handling:** It has a long shelf-life (>2 years) but once the overwrap is removed, the solution must be used within 24 hours, even if stored in a refrigerator, as it has no preservative and slow oxygenation results in methaemoglobin formation.

**Contraindications:** Use with caution in animals with advanced heart disease or renal impairment (oliguria/anuria) as it can cause volume overload.

**Adverse reactions:** Rapid administration to normovolaemic animals could result in hypervolaemia. The solution causes a discoloration of plasma (red, brown) and mucous membranes, sclera, urine and skin (yellow, brown or red). Vomiting, diarrhoea and fever have been reported. There is an increase in plasma total protein and haemoglobin that can artefactually change derived red cell indices on blood screens. Increased liver enzymes have been noted in toxicity trials in Beagles. Haemoglobinuria is expected and significant urine discoloration can interfere with other colorimetric changes on dipsticks. The package insert contains notes of known interferences with clinical chemistry analysers. Ideally obtain all diagnostic blood and urine samples before administration. The main complication of administration to cats is volume overload, leading to pulmonary oedema and pleural effusions; partly due to its potent colloid osmotic effects (slightly better than those of hetastarch) but probably also due to its nitric oxide-scavenging properties leading to vasoconstriction.
**Drug interactions:** Avoid concomitant administration with other plasma-volume expanders. The manufacturer states that no other medications should be added to the infusion line whilst oxyglobin is being administered. No specific interactions are yet reported.

**DOSES**

**Dogs:** 30 ml/kg i.v. at a rate of 0.5-3 ml/kg/h prn.

**Cats:** 5-10 ml/kg i.v. at a rate of 0.5-1ml/kg/h prn.

**Small mammals:** No information available.

**Birds:** 30 ml/kg i.v., intraosseously divided over 24 hours.

**Reptiles:** 1-2 ml/kg i.v., intraosseously as a slow bolus injection prn.

---

**Halothane** (Fluothane, Halothane) POM-V

**Formulations:** Inhalational: 250 ml bottle.

**Action:** Not fully understood.

**Use:** Induction and maintenance of anaesthesia. Halothane is potent and highly volatile so should only be delivered from a suitable calibrated vaporizer. It is more soluble in blood than isoflurane and sevoflurane therefore induction and recovery from anaesthesia are slower than with the other agents. The concentration of halothane required to maintain anaesthesia depends on the other drugs used in the anaesthesia protocol; the concentration should be adjusted according to clinical assessment of anaesthetic depth.

**Safety and handling:** Unstable when exposed to light and corrodes certain metals. It dissolves into rubber and may leach out into breathing circuits after the vaporizer is turned off. Measures should be adopted to prevent contamination of the environment with halothane during anaesthesia and handling of the agent.

**Contraindications:** Halothane causes a reduction in liver blood flow, therefore use of halothane in patients with liver disease is undesirable.

**Adverse reactions:** Halothane causes dose-dependent hypotension through depression of heart rate and myocardial contractility, although these adverse effects wane with time. Halothane facilitates the generation of ventricular arrhythmias in the presence of other arrhythmogenic factors, e.g. catecholamines, hypoxia and hypercarbia. Halothane crossed the placental barrier and will effect neonates delivered by caesarean section. Up to 25% of inhaled halothane undergoes oxidative metabolism by hepatic cytochrome.

**Drug interactions:** Opioid agonists, benzodiazepines and N₂O reduce the concentration of halothane required to achieve surgical anaesthesia.

**DOSES**

**Dog, Cats, Small mammals:** The expired concentration required to maintain surgical anaesthesia in 50% of recipients is 0.8-1.0% in animals (minimum alveolar concentration). Administration of other anaesthetic agents and opioid analgesics reduces the dose
requirement of halothane, therefore the dose should be adjusted according to individual requirement. Halothane at 3-4% concentration is required to induce anaesthesia in unpremedicated patients.

_Birds:_ Do not use.

_Reptiles:_ Snakes and Lizards: 3-5% with 100% oxygen for induction, 1-3% in 100% oxygen for maintenance.

**hCG** see **Chorionic gonadotrophin**

**Heparin (low molecular weight)** *(Dalteparin, Enoxaparin, LMWH)* *(Fragmin (dalteparin)*, Clexane (enoxaparin)*)

**Formulations:** Injectable: 2,500 IU/ml, 10,000 IU/ml ampules *(Dalteparin)*; 25,000 IU/ml multidose vial plus various pre-filled syringes at concentrations of 12,500 IU/ml and 25,000 IU/ml *(Dalteparin)*; pre-filled syringes of 100 mg/ml *(Enoxaparin)*. 100 mg enoxaparin is equivalent to 10,000 IU of anti-Factor Xa activity.

**Action:** Low molecular weight heparin (LMWH) is an anticoagulant that inhibits factor Xa and thrombin. When compared with unfractionated heparin (UFH), LMWH has reduced anti-IIa activity relative to anti-Xa activity (ratio of anti-Xa to anti-IIa is 2-4:1 compared to UFH 1:1) Thus at therapeutic doses LMWH has minimal effect on APTT. Therapeutic monitoring of LMWH is by anti-Xa activity (but this may not be practical).

**Use:** Treatment of DIC and thromboembolic disease. Its use in DIC is controversial. Uncontrolled case series from human medicine claim success whereas a beneficial effect has not been shown in controlled clinical trials. Heparin is also used in treatment of myocardial infarction, atrial fibrillation, deep vein thrombosis and pulmonary thromboembolism in humans. LMWH has better pharmacokinetic properties than UFH and its actions are more predictable. It is considerably more expensive than UFH. Heparins are only effective if sufficient AT III is present; provision of fresh or frozen plasma is required in AT III-deficient animals for heparin to be effective. Heparin therapy is only one aspect of the management of DIC: addressing the precipitating cause, administration of fluids, fresh whole blood, aspirin and diligent monitoring of coagulation tests (APTT, OSPT), fibrin degradation products and fibrinogen are all important factors. The doses of heparin are controversial, with some texts recommending lower or higher doses, the use of constant i.v. infusions, or preincubation with plasma.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Bleeding disorders or severe renal dysfunction.

**Adverse reactions:** If an overdosage occurs protamine can be used as an antidote. Heparin should not be administered i.m. as it may
result in haematoma formation. Its use in DIC may worsen haemorrhage and some texts indicate it is contraindicated where DIC is due to sepsis. Heparin-induced thrombocytopenia syndrome is a serious concern in human patients.

**Drug interactions:** Use with caution with other drugs that can cause changes in coagulation status (e.g. aspirin, NSAIDs, warfarin). Heparin may antagonize ACTH, corticosteroids or insulin. Heparin may increase plasma levels of diazepam. The actions of heparin may be partially counteracted by antihistamines, digoxin and tetracyclines. Do not mix other drugs in the same syringe as heparin.

**DOSES**

**Dogs, Cats:**
- Prevention of DIC: 100 IU/kg s.c. q12-24h.
- Treatment of DIC: 100-200 IU/kg i.v. initially if acute; may repeat in 4 h, then adjust dose prn and repeat s.c. q8h. repeated above.
- Treatment of thromboembolic disease: 100-200 IU/kg i.v. as a loading dose, followed by 200-300 IU/kg s.c. q6-8h Aim to get anti-Factor Xa activity of 0.35-0.7 IU/ml (though in many cases it may not be possible to measure this).

**Small mammals:** No information available.

**Birds:** PTFE toxicosis: 300 IU/kg i.v. once.

**Reptiles:** No information available.

**Heparin (unfractionated) (UFH) (Heparin*, Hepsal*) POM**

**Formulations:** Injectable: 1,000-25,000 IU/ml solutions; 10 IU/ml in saline, 100 IU/ml in saline.

**Action:** Heparin is an anticoagulant that exerts its effects primarily by enhancing the binding of antithrombin III (AT III) to factors IIa, IXa, Xa, Xla and XIIa; it is only effective if adequate AT III is present. The AT III/clotting factor complex is subsequently removed by the liver. Heparin inactivates thrombin and blocks the conversion of fibrinogen to fibrin. The inhibition of factor XII activation prevents the formation of stable fibrin clots. Heparin does not significantly change the concentrations of clotting factors, nor does it lyse pre-existing clots.

**Use:** Treatment of DIC and thromboembolic disease (for more details see low molecular weight heparin above). Therapy must be carefully monitored as the activity of UFH is somewhat less predictable than low molecular weight heparin. In veterinary medicine it is mainly used to maintain the patency of catheters/cannulae.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Major bleeding disorders, increased risk of haemorrhage, thrombocytopenia.

**Adverse reactions:** If an overdosage occurs protamine can be used as an antidote. Heparin should not be administered i.m. as it may result in haematoma formation. Its use in DIC may worsen
haemorrhage and some texts indicate it is contraindicated where DIC is due to sepsis. Heparin-induced thrombocytopenia syndrome is a serious concern in human patients.

**Drug interactions:** Use with caution with other drugs that can cause changes in coagulation status (e.g. aspirin, NSAIDs, warfarin). Heparin may antagonize ACTH, corticosteroids and insulin. Heparin may increase plasma levels of diazepam. The actions of heparin may be partially counteracted by antihistamines, digoxin and tetracyclines. Do not mix other drugs in the same syringe as heparin.

**DOSES**

**Dogs:**
- Catheter maintenance: 1250 IU in 100 ml water for injection.
- Treatment of DIC: low dose 75 IU/kg q8h; high dose 200 IU/kg q6h (see LMWH for more information).
- Treatment of pulmonary thromboembolism: 200-500 IU/kg s.c. q6-8h concurrently with warfarin; adjust dosage so that the APTT is 1.5-2.0 times normal or anti-Factor Xa activity between 0.35 and 0.7 IU/ml (see LMWH for more information).

**Cats:** Feline arterial thromboembolism: 250-300 IU/kg s.c. q8h.

**Small mammals, Birds, Reptiles:** No information available.

**Human chorionic gonadotrophin** see **Chorionic gonadotrophin**

**Hyaluronate** (Vislube*) P

**Formulations:** Ophthalmic: 0.18% solution in single-use vials.

**Action:** Viscoelastic fluid with mucomimetic properties. Sodium hyaluronate is also available in different formulations as a viscoelastic for intraocular surgery.

**Use:** Used as a tear replacement and is beneficial for the management of keratoconjunctivitis sicca (KCS or dry eye). It has longer corneal contact time than the aqueous tear substitutes.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** It is tolerated well and ocular irritation is unusual.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats, Small mammals:** 1 drop per eye q4-6h, although it can be used hourly if required.

**Birds, Reptiles:** No information available.
Hydralazine (Hydralazine*, Apresoline*) POM

Formulations: Oral: 25 mg, 50 mg tablets.

Action: Hydralazine acts chiefly on arteriolar smooth muscle causing vasodilation; it is able to decrease systemic vascular resistance to about 50% of the baseline value. The effects of hydralazine are to reduce afterload and increase heart rate, stroke volume and cardiac output.

Use: Treatment of congestive heart failure in dogs secondary to severe mitral value insufficiency. It can be used to treat systemic hypertension. Hospitalization with frequent monitoring of blood pressure is advised during its use. It is not typically used as a first-line drug in hypertension.

Safety and handling: Normal precautions should be observed.

Contraindications: Hypovolemia, hypotension, renal impairment or cerebral bleeding.

Adverse reactions: Reflex tachycardia, severe hypotension (monitor and adjust doses as necessary), anorexia and vomiting (the latter two effects commonly seen in cats). As hydralazine may activate the renin-angiotensin-aldosterone system, concomitant use of diuretic therapy, ACE inhibitors and/or salt restriction is often necessary.

Drug interactions: The hypotensive effects of hydralazine may be enhanced by ACE inhibitors (e.g. enalapril), anaesthetics, beta-blockers (e.g. propranolol), calcium-channel blockers (e.g. diltiazem, verapamil), corticosteroids, diuretics and NSAIDs. Sympathomimetics (e.g. phenylpropanolamine) may cause tachycardia.

DOSES

**Dogs:** 0.5-3 mg/kg p.o. q8-12h. Start at 0.5-1 mg/kg q12h. Monitor blood pressure regularly and increase to 2 mg/kg or even 3 mg/kg q12h if necessary.

**Cats:** 2.5-10 mg/cat p.o. q12h. Titrate upwards cautiously as above if necessary.

**Small mammals:** Guinea pigs: 1 mg/kg i.v. prn.

**Birds, Reptiles:** No information available.

Hydrochlorothiazide (Co-amilozide*) POM

Formulations: Oral: 25 mg hydrochlorothiazide + 2.5 mg amiloride, 50 mg hydrochlorothiazide + 5 mg amiloride tablets.

Action: Thiazide diuretic that inhibits resorption of sodium and causes secretion of potassium in the distal convoluted tubule. It is formulated with a potassium-sparing diuretic (amiloride).

Use: Management of ascites, pleural effusion, oedema and hypertension. It may also be used to reduce polydipsia in nephrogenic diabetes insipidus and in the prevention of calcium oxalate urolithiasis. It is most often added to furosemide, a more potent diuretic, when heart failure becomes refractory to furosemide therapy.
Safety and handling: Normal precautions should be observed.

Contraindications: Renal impairment, as it tends to reduce renal blood flow.

Adverse reactions: Hyperglycaemia, hypokalaemia, hyponatraemia and volume contraction. It enhances the effects of the renin-angiotensin-aldosterone system in heart failure.

Drug interactions: Increased possibility of hypokalaemia developing if thiazides are used concomitantly with corticosteroids or loop diuretics (furosemide). Thiazide-induced hypokalaemia may increase the risk of digoxin toxicity. Thus, potassium therapy may be necessary during prolonged administration. The concurrent administration of vitamin D or calcium salts with thiazides may exacerbate hypercalcaemia.

DOSES

Dogs: 12.5-25 mg/dog i.m. or 1-5 mg/kg p.o. q12h with a salt-restricted diet.

Cats: 12.5 mg/cat i.m. or 2-4 mg/kg p.o. q12h with a salt-restricted diet.

Small mammals, Birds: No information available.

Reptiles: 1 mg/kg q24-72h.

Hydrocortisone (Hydrocortisone*, Hydrocortisone and Neomycin, Solu-cortef*, Efcorosol*, Vetodale) POM, POM-V

Formulations: Topical: 0.5%, 1% creams, 1% solution (Hydrocortisone). It is also a constituent of many veterinary authorized mixed topical preparations. Injectable: 25 mg/ml solution; 100 mg, 500 mg powders for reconstitution (Solu-cortef). Oral: 10 mg, 20 mg tablets (Hydrocortone).

Action: Alters the transcription of DNA, leading to alterations in cellular metabolism. It has both glucocorticoid and mineralocorticoid activity.

Use: Topical anti-inflammatory drug used in the management of hypoadrenocorticism and treatment of shock. It has only 1/4 of the glucocorticoid potency of prednisolone and 1/30 of that of dexamethasone. On a dose basis 4 mg of hydrocortisone is equivalent to 1 mg prednisolone. The value of glucocorticoids in the treatment of shock is controversial. Animals on chronic therapy should be tapered off steroids when discontinuing the drug (even following topical administration).

Safety and handling: Wear gloves when applying topically as the cream is absorbed through skin.

Contraindications: Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus. Impaired wound healing and delayed recovery from infections may be seen.
Adverse reactions: Catabolic effects of glucocorticoids leads to weight loss and cutaneous atrophy. Iatrogenic hyperadrenocorticism may develop (PU/PD, elevated liver enzymes). Vomiting and diarrhoea, or GI ulceration may develop. Glucocorticoids may increase urine glucose levels and decrease serum T3 and T4 values. Prolonged use of glucocorticoids suppresses the hypothalamic-pituitary axis and causes adrenal atrophy.

Drug interactions: Increased risk of GI ulceration if used concurrently with NSAIDs. Glucocorticoids antagonize the effect of insulin. Antiepileptic drugs (phenobarbital, primidone) may accelerate the metabolism of corticosteroids. There is an increased risk of hypokalaemia when corticosteroids are used with acetazolamide, amphotericin and potassium-depleting diuretics (furosemide, thiazides).

DOSES

Dogs:
- Topically: Apply a thin layer of cream to affected area q6-12h.
- Hypoadrenocorticism: 2-4 mg/kg i.v., i.m. q4-6h in acute Addisonian crisis and 0.125 mg/kg p.o. q12h for maintenance.
- Shock: 1-10 mg/kg i.v. once, 5-10 mg/kg i.m. once.
- Anti-inflammatory: 0.5 mg/kg p.o. q12h.

Cats: Topical use as for dogs. Its use in feline hypoadrenocorticism has not been documented.

Small mammals, Birds, Reptiles: No information available.

Hydrocortisone aceponate (Cortavance) POM-V

Formulations: Topical: 76 ml spray (0.584 mg/ml).

Action: Hydrocortisone aceponate is a pro-drug which is biotransformed in the epidermis to its active form hydrocortisone 17 propionate.

Use: Treatment of inflammatory and pruritic dermatoses. Microbial infections should be treated appropriately prior to use. Minimizes systemic side effects (such as increases in liver enzymes, depression of cortisol response to ACTH stimulation).

Safety and handling: Normal precautions should be observed.

Contraindications: Caution in dogs <7 months old as glucocorticoids are known to slow growth.

Adverse reactions: Protracted use of any topical glucocorticoid can result in epidermal atrophy. Patients should be monitored appropriately with long-term use.

Drug interactions: No information available.

DOSES

Dogs: Topical: 2 pumps of spray per 10 cm x 10 cm square of skin for 7 days. This delivers 1.52 µg of hydrocortisone aceponate per cm² square.
**Cats:** Dose not established.  
**Small mammals, Birds, Reptiles:** No information available.

**Hydroxycarbamide** (Hydroxyurea) (Hydrea*) POM  
**Formulations:** Oral: 500 mg capsule.  
**Action:** Inhibits ribonucleotide reductase which converts ribonucleotides to deoxyribonucleotides which are important precursors for DNA synthesis and repair.  
**Use:** Treatment of polycythaemia vera and chronic granulocytic leukaemia. Once in remission, reduce dosage frequency as required to maintain remission.  
**Safety and handling:** Disposable gloves should be worn to handle/administer capsules. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.  
**Contraindications:** Patients with bone marrow suppression. Use with caution in patients with renal dysfunction; dosage reduction may be required.  
**Adverse reactions:** Myelosuppression, nausea and skin reactions. Myelosuppression is dose-limiting, monitor haematological parameters at regular intervals.  
**Drug interactions:** No information available.  
**DOSES**  
**Dogs:** 50 mg/kg p.o. q24h for 1-2 weeks then q48h, or 80 mg/kg p.o. q3d or 1 g/m² p.o. q24h until haematology is normal.  
**Cats:** 10 mg/kg p.o. q12h for 3 days per week until haematology is normal.  
**Small mammals, Birds, Reptiles:** No information available.

**Hydroxyurea** see **Hydroxycarbamide**

**Hydroxyzine** (Atarax*, Ulcerex*) POM  
**Formulations:** Oral: 10 mg, 25 mg tablets; 2 mg/ml syrup.  
**Action:** Binds to H1 histamine receptors preventing histamine from binding.  
**Use:** Management of allergic disease in dogs and cats, though specific doses have not been determined by pharmacokinetic studies. Also used in feather plucking in birds.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction.
Adverse reactions: May cause mild sedation. May reduce seizure threshold.
Drug interactions: No information available.
DOSES
Dogs, Cats: 2.0-2.2 mg/kg q8-12h.
Small mammals: Ferrets: 2 mg/kg p.o q8h.
Birds: 2.2 mg/kg q8h.
Reptiles: No information available.

Hyoscine see Butylscopolamine

Hypromellose (Hypromellose*, Isopto*, Tears Naturale*) P
Formulations: Ophthalmic: 0.3%, 0.5%, 1% solutions in 10 ml dropper bottle; 0.32% (single-use vial).
Action: Cellulose based tear substitute (lacromimetic).
Use: Lubrication of dry eyes. In cases of keratoconjunctivitis (KCS or dry eye) it will improve ocular surface lubrication, tear retention and patient comfort while lacrostimulation therapy (e.g. topical ciclosporin) is initiated. It may also be used as a vehicle base for compounding ophthalmic drugs. Patient compliance is poor if used >q4h, consider using a longer acting tear replacement.
Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: No information available.
Drug interactions: No information available.
DOSES
Dogs, Cats: 1 drop per eye q1h.
Small mammals: 1 drop per eye q1h during anaesthesia.
Birds, Reptiles: No information available.

Ibafloxacin (Ibaflin) POM-V
Formulations: Oral: 3% gel (30 mg/g) in a metered dose applicator.
Action: Inhibits the enzyme DNA gyrase. Its bactericidal action is concentration-dependent as reflected by the once daily dosing regime.
Use: Has a broad spectrum of activity. It is active against mycoplasmas, many Gram-negative organisms and some Gram-positive organisms, including Pasteurella spp., Staphylococcus spp., Pseudomonas aeruginosa, Klebsiella spp., Escherichia coli, Proteus spp. and Salmonella spp. It is effective against beta-lactamase-producing bacteria but ineffective against obligate
anaerobes. It is highly lipophilic, attaining high concentrations within cells in many tissues and is particularly effective in the management of soft tissue, urogenital (including prostatic) and skin infections. Ibafloxacin is specifically authorized for the treatment of pyoderma caused by susceptible strains of *Staphylococcus*, *E. coli* and *Proteus*, for the management of soft tissue infections and of upper respiratory tract infections. Administer at the time of feeding as food enhances the absorption.

**Safety and handling:** Each syringe should be dedicated to treatment of a single animal and used within 8 weeks of opening.

**Contraindications:** Cartilage abnormalities have been reported following the use of other fluoroquinolones in growing animals. Such abnormalities have not been specifically reported following the use of ibafloxacin but the drug is not authorized for use in cats and dogs <8 months of age and in giant breeds this is extended to 18 months. Ibafloxacin is specifically contraindicated for use in combination with NSAIDs in animals with a history of seizures. Caution should be exercised before using dose rates above those recommended by the manufacturer.

**Adverse reactions:** Some animals may show GI signs following use of fluoroquinolones (nausea, vomiting, diarrhoea or soft faeces). The drug should be used with caution in epileptics as fluoroquinolones potentiate CNS adverse effects when administered concurrently with NSAIDs in humans. The potential adverse effects of ibafloxacin on the canine retina have not been studied (see enrofloxacin).

**Drug interactions:** Absorbents and antacids containing cations (Mg²⁺, Al³⁺) may bind fluoroquinolones, preventing their absorption from the GI tract. The absorption of fluoroquinolones may be inhibited by sucralfate and zinc salts; separate doses of these drugs by at least 2 hours. Cimetidine may reduce the clearance of fluoroquinolones and so should be used with caution with these drugs. Antagonism may be observed with nitrofurantoin.

**DOSES**

**Dogs, Cats:** 15 mg/kg p.o. q24h or 0.5 ml/kg p.o. q24h.

**Small mammals, Birds, Reptiles:** No information available.

**Imidacloprid** (Advantage, Advantix, Advocate) POM-V

**Formulations:** Topical: 10% w/v imidacloprid in 0.4 ml, 0.8 ml, 1.0 ml, 2.5 ml and 4.0 ml pipettes for spot-on application (Advantage); 10% w/v imidacloprid + 50% w/v permethrin in 0.4 ml, 1.0 ml, 2.5 ml and 4.0 ml pipettes for spot-on application (Advantix).

**Action:** Binds to post-synaptic nicotinic receptors resulting in paralysis and death of fleas and their larvae. Permethrin is a sodium ‘open channel blocker’ that causes prolongation of the action potential and therefore paralysis and death of fleas.
**Use:** Treatment and prevention of flea and tick infestations in dogs, cats and flea infestations in rabbits. Formulations with permethrin also have repellant activity against sandflies (*Phlebotomus* spp.) Mosquitoes (*Aedes aegypti, Culex pipiens*) and stable flies (*Stomoxys calcitrans*) in dogs.

For the treatment of flea infestations the additional use of an approved insect growth regulator is recommended and the product should be applied every 4 weeks to all in-contact cats, dogs and rabbits. May be used in nursing bitches and queens. The recommended minimum dose of Advantix is 10 mg/kg imidacloprid + 50mg/kg permethrin.

**Safety and handling:** Permethrin is dangerous to aquatic organisms. Treated dogs should not swim in surface water for 48 hours.

**Contraindications:** The permethrin-containing product should not be used on cats.

**Adverse reactions:** Transient pruritus and erythema at the site of application may occur.

**DOSES**

**Dogs:** 0.4 ml, 1.0 ml, 2.5 ml, 4 ml pipettes. In dogs >40kg the appropriate combination of pipettes should be applied.

**Cats:** 0.4 ml, 0.8 ml pipettes (use the smaller size in cats <4 kg). Do not use the permethrin-containing product.

**Small mammals:** Rabbits 0.4 ml, 0.8ml pipettes (use the smaller size in rabbits <4 kg).

**Birds, Reptiles:** No information available.

**Imidapril** (Prilium) POM

**Formulations:** Oral: 75 mg, 150 mg, 300 mg powders for reconstitution.

**Action:** Imidapril is a pro-drug, which is hydrolysed to form an active metabolite imidoprilat. Imidoprilat inhibits angiotensin-converting enzymes, thereby inhibiting conversion of angiotensin I to angiotensin II. Angiotensin II, a potent vasopressor, stimulates release of aldosterone and vasopressin, facilitates the central and peripheral effects of the sympathetic nervous system and preserves the glomerular filtration rate. Inhibiting angiotensin II production results in veno- and arteriodilation, which leads to decreased preload and afterload, and lowered blood pressure. Imidapril reduces salt and water retention.

**Use:** Management of congestive heart failure and hypertension. The liquid formulation may make it easier to administer to cats than enalapril, although it is not authorized for use in this species.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in animals with acute renal failure, congenital heart disease, haemodynamically relevant stenoses (e.g. aortic stenosis), obstructive hypertrophic cardiomyopathy or hypovolaemia.
Adverse reactions: Hypotension, renal impairment, hyperkalaemia, diarrhoea, fatigue, anorexia and hypotension are potential adverse effects. If hypotension should develop administer normal saline.

Drug interactions: There is a risk of hyperkalaemia developing if imidapril is used with NSAIDs, potassium-sparing diuretics and potassium supplementation. The concurrent use of diuretics, vasodilators or low-sodium diets with imidapril may result in hypotension.

DOSES

**Dogs:** 0.25 mg/kg p.o. q24h with or without food.

**Cats:** Not authorized but doses of 0.25 mg/kg p.o. q24h with or without food have been used.

**Small mammals, Birds, Reptiles:** No information available.

Imidocarb dipropionate (Imizol*) POM

Formulations: Injectable: 85 mg/ml solution.

**Action:** Unclear but may be due to interference with inositol uptake by the erythrocyte containing the parasite or by interference with polyamine metabolism.

**Use:** Treatment of *Babesia canis* infection in dogs. The safety and effectiveness of imidocarb have not been fully determined in puppies or in breeding, lactating or pregnant animals.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer i.v.

**Adverse reactions:** Cholinergic signs (e.g. salivation, vomiting and occasionally diarrhoea, panting, restlessness) may develop after dosing. These may be alleviated by atropine. Mild injection site inflammation lasting one to several days and which may ulcerate has been reported. Anaphylactoid reactions have been reported in cattle but not in dogs.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 6.6 mg/kg i.m., s.c. once, repeated in 2-3 weeks.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

Imipenem (Primaxin*) POM

Formulations: Injectable: 500 mg powder with cilastatin (as sodium salt) 500 mg for reconstitution (i.v., i.m. preparations which are not interchangeable).

**Action:** As other beta-lactams, acts as an antimicrobial through inhibiting cell wall synthesis. It remains very stable in the presence of beta-lactamase produced by a variety of bacteria, and is resistant to beta-lactamases from some Gram-negatives that can destroy most other beta-lactam antibiotics.
Use: Very broad spectrum of activity against aerobic and anaerobic Gram-positive and Gram-negative bacteria. It is particularly important for its activity against *Pseudomonas aeruginosa* and the *Enterococcus* species. However it is not active against methicillin-resistant *Staphylococcus aureus*. Imipenem should not be considered for routine use in veterinary medicine and increased use will contribute to resistant infections and superinfections. In human medicine use is restricted to highly resistant infections and imipenem should therefore only be used when indicated by bacterial culture and sensitivity testing and when no other options are available. Due to the reported development of resistance during treatment of *Pseudomonas aeruginosa* infections there is some suggestion that imipenem should be combined with an aminoglycoside. Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with cilastatin, a specific enzyme inhibitor, which blocks its renal metabolism.

Safety and handling: Normal precautions should be observed.

Contraindications: Renal disease. Contraindicated in humans who are allergic to penicillin and other beta-lactam antibiotics.

Adverse reactions: Nausea and vomiting are common in humans. Imipenem can also cause seizures. Neurotoxicity has been observed when used at high doses in humans or in renal failure.

Drug interactions: May have additive or synergistic effects with aminoglycosides when treating some bacterial infections. Antagonism may occur with other beta lactam antibacterials.

DOSES

**Dogs:** Empirical, but doses of 5-10 mg/kg i.v., i.m., s.c. q8h have been suggested.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Imipramine** (Imipramine*) POM

Formulations: Oral: 10 mg, 25 mg tablets.

Action: Imipramine blocks norepinephrine and serotonin re-uptake in the brain, resulting in antidepressive activity.

Use: Can be used in the management of fear-induced, generalized and separation anxiety, especially when these conditions are associated with urine elimination. It may also be used to aid control of supersubmissive urination and excitatory urination, narcolepsy, and may assist learning in anxious subjects. The atypical tricyclic antidepressant clomipramine is authorized for use in dogs.

Contraindications: Glaucoma, history of seizures or urinary retention, severe liver disease, hypersensitivity to tricyclic antidepressants. Use with caution in young animals.

Adverse reactions: Sedation, dry mouth, diarrhoea, vomiting, excitability, arrhythmias, hypotension, syncope and increased appetite are reported in humans.
Drug interactions: Should not be used with monoamine oxidase inhibitors or drugs that are metabolized by cytochrome P450 2D6 (e.g. chlorpheniramine, cimetidine).

DOSES

Dogs: 1-2 mg/kg p.o. q12h or 2-4 mg/kg p.o. q24h.
Cats: 0.5-1 mg/kg p.o.q12-24h.
Small mammals, Birds, Reptiles: No information available.

Insulin (Caninsulin, Insuvet, Petsulin) POM-V

Formulations: Injectable: 40 IU/ml, 100 IU/ml suspensions (for s.c. injection) or 100 IU/ml solution (for i.v. or i.m. injection). There are many preparations authorized for use in humans; however, veterinary authorized preparations are preferential for both legal and medical reasons.

Action: Binds to specific receptors on the cell surface which then stimulate the formation of glycogen from glucose, lipid from free fatty acids, protein from amino acids and many other metabolic effects.

Use: Treatment of insulin-dependent diabetes mellitus (IDDM) and occasionally as adjunctive therapy in the management of hyperkalaemia. There are various types of insulin (see tables). Neutral (soluble) insulin is the normal crystalline form. The lente insulins rely on different concentrations of zinc and size of zinc-insulin crystals to provide different durations of activity. PZI is complexed with the protein protamine and has a very long duration of action. Further advice on the use of insulin should be obtained from an authoritative source such as the BSAVA Manual of Canine and Feline Endocrinology.

* = Not authorized for veterinary use.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Hypoglycaemia. Patients with hyperkalaemia due to adrenocortical insufficiency may be more susceptible to the hypoglycaemic effects of insulin and therefore the hyperkalaemia in such patients should be preferentially treated by alternative means.

**Adverse reactions:** Overdosage results in hypoglycaemia and hypokalaemia.

**Drug interactions:** Corticosteroids, thiazide diuretics and thyroid hormones may antagonize the hypoglycaemic effects of insulin. Anabolic steroids, beta-adrenergic blockers (e.g. propranolol), ethanol, phenylbutazone, salicylates and tetracycline may increase insulin’s effect. Administer with caution and monitor patients closely if digoxin is given concurrently. Beta-agonists, such as terbutaline, may prevent or lessen insulin-induced hypoglycaemia in humans. This effect has not been investigated in dogs or cats.

**DOSES**

**Dogs:**
- **IDDM:** Initially 0.25-0.5 IU/kg (dogs >25 kg) or 0.5-1 IU/kg (dogs <25 kg) of Lente insulin s.c. q12-24h. Adjust dose and frequency of administration by monitoring clinical effect, urine results, blood glucose and/or fructosamines.
- **Diabetic ketoacidosis:** 0.2 IU/kg soluble insulin i.m. initially followed by 0.1 IU/kg i.m. q1h. Alternatively i.v. infusions may be given (though are not reported to be better) at 0.025-0.06 IU/kg/h of soluble insulin. Run approximately 50 ml of i.v. solution through tubing as insulin adheres to glass and plastic; change insulin/saline solution q6h.
- **Hyperkalaemic myocardial toxicity:** give a bolus of 0.5 IU/kg of soluble insulin i.v. followed by 2-3 g of dextrose/unit of insulin. Half the dextrose should be given as a bolus and the remainder administered i.v. over 4-6h.
Cats:

- IDDM: Initially 0.25 IU/kg of PZI s.c. q12-24h or 0.25 IU/kg of Lente insulin s.c. q12h. Adjust dose and frequency of administration by monitoring clinical effect, blood glucose and/or fructosamine levels.
- Diabetic ketoacidosis: Doses as for dogs.
- Hyperkalaemic myocardial toxicity: Doses as for dogs.

Small mammals, Birds, Reptiles: No information available.

Interferons see page 406

Iron salts (Ferrous sulphate, Ferrous fumarate, Ferrous gluconate, Iron dextran) (CosmoFer, Scordex) POM-VPS, POM, GSL

Formulations: Injectable: 50 mg/ml iron dextran (CosmoFer), 200 mg/ml iron dextran (Scordex). Oral: 200 mg FeSO₄ tablet (ferrous sulphate), ferrous gluconate and other formulations in variable tablet and liquid preparations; ferrous fumarate preparations also typically contain folic acid.

Action: Essential for oxygen-binding in haemoglobin, electron transport chain and oxidative phosphorylation, and other oxidative reactions in metabolism.

Use: Treatment of iron deficiency anaemia and conditions where red blood cell synthesis is high and iron stores are depleted. The oral route should be used if possible. Iron absorption is complex and dependent in part on physiological demand, diet composition, current iron stores and dose. Valid reasons for administering iron parenterally are failure of oral therapy due to severe GI adverse effects, continuing severe blood loss, iron malabsorption, or a non-compliant patient. Modified-release preparations should be avoided as they are ineffective. Iron is absorbed in the duodenum and the release of iron from modified-release preparations occurs lower down the GI tract.

Safety and handling: Normal precautions should be observed.

Contraindications: Severe infection or inflammation, intolerance to the oral preparation, any anaemia other than iron deficiency anaemia, presence of GI ulcers. Also contraindicated in patients with hepatic, renal (particularly pyelonephritis) or cardiac disease, and untreated urinary tract infections.

Adverse reactions: Parenteral iron may cause arrhythmias, anaphylaxis, shunting of iron to reticuloendothelial stores and iron overload. Oral iron may cause nausea, vomiting, constipation and diarrhoea. High doses may be teratogenic and embryotoxic (injectable iron dextran).

Drug interactions: Chloramphenicol can delay the response to iron dextran and its concurrent use should be avoided. Oral preparations bind to tetracyclines and penicillamine causing a decrease in efficacy. Antacids, milk and eggs significantly decrease the bioavailability of oral iron.
DOSES

**Dogs:** 100-600 mg/dog p.o. q24h or 10-20 mg/kg i.m. once only, followed by oral therapy.

**Cats:** Chronic renal failure: 50 mg i.m. every 3-4 weeks in conjunction with erythropoietin in chronic renal failure or 20-25 mg i.m. once followed by 50-100 mg/cat p.o. q24h. Note that the majority of cats do not tolerate oral iron therapy and require parenteral treatment.

**Small mammals:** 10 mg/kg i.m. of iron dextran once weekly or prn.

**Birds:** 10 mg/kg i.m. of iron dextran.

**Reptiles:** No information available.

---

**Isoflurane** (Isocare, Isofane, Isoflo, Isoflurane Vet, Vetflurane)

**POM-V**

**Formulations:** Inhalational: 100 ml bottle.

**Action:** Halogenated ethyl methyl ether and structural isomer of enflurane. The mechanism of action of volatile anaesthetic agents is not fully understood.

**Use:** Induction and maintenance of anaesthesia. Isoflurane is potent and highly volatile so should only be delivered from a suitable calibrated vaporizer. It is less soluble in blood than halothane but more soluble than sevoflurane, therefore induction and recovery from anaesthesia are quicker than halothane but slower than sevoflurane. The concentration of isoflurane required to maintain anaesthesia depends on the other drugs used in the anaesthesia protocol; the concentration should be adjusted according to clinical assessment of anaesthetic depth. Isoflurane has a pungent smell and induction to anaesthesia using chambers or masks may be less well tolerated in small dogs and cats compared with halothane.

**Safety and handling:** Measures should be adopted to prevent contamination of the environment with isoflurane during anaesthesia and when handling of the agent.

**Contraindications:** Avoid gaseous induction in chelonians as they can breath-hold.

**Adverse reactions:** Isoflurane causes dose-dependent hypotension by causing vasodilation, particularly in skeletal muscle. This adverse effect does not wane with time. Isoflurane is a more potent respiratory depressant than halothane, respiratory depression is dose-dependent. Isoflurane does not sensitize the myocardium to catecholamines to the extent that halothane does, but can generate arrhythmias in certain conditions. Assertions that isoflurane is safer than halothane in certain high-risk cases should be discounted. Isoflurane is not metabolized by the liver (0.2%) and has less effect on liver blood flow compared with halothane.

In ferrets isoflurane can cause marked depression in haematological parameters (especially haematocrit, RBC count, Hb concentration)
rapidly after induction, so care should be taken in interpreting blood results if isoflurane is used for restraint, or in anaemic or debilitated ferrets.

**Drug interactions:** Opioid agonists, benzodiazepines and N₂O reduce the concentration of isoflurane required to achieve surgical anaesthesia. The duration of action of non-depolarizing neuromuscular blocking agents is longer with isoflurane compared with halothane anaesthetized animals.

**DOSES**

**Dogs:** The expired concentration required to maintain surgical anaesthesia in 50% of dogs is 1.2% (minimum alveolar concentration). Administration of other anaesthetic agents and opioid analgesics reduces the dose requirement of isoflurane, therefore the dose should be adjusted according to individual requirement. 3-5% isoflurane concentration is required to induce anaesthesia in unpremedicated patients.

**Cats:** Doses as for dogs. The expired concentration required to maintain surgical anaesthesia in 50% of cats is 1.6% (minimum alveolar concentration).

**Small mammals:** **Ferrets:** Doses as for dogs.

**Birds:** Doses as for dogs.

**Reptiles:** 3-5% in 100% oxygen for induction in snakes and lizards; 2-4% in 100% oxygen for maintenance.

**Isosorbide dinitrate** (Cedocard, Isoket, Isosorbide) POM

**Formulations:** Injectable: 1 mg/ml solution for i.v. use (Isoket). Oral: 10 mg, 20 mg, 40 mg tablets.

**Action:** Systemic vasodilator. Its major benefit follows from a reduction in venous return as a consequence of venodilation. A decrease in venous return reduces left ventricular work.

**Use:** Short-term management of oedema (particularly acute pulmonary oedema) and to reduce ventricular filling pressures in animals with congestive cardiac failure. It may be beneficial in cases of right-sided congestive heart failure to help reduce ascites and pleural effusion (in combination with standard heart failure medication). It is used in conjunction with diuretics and ACE inhibitors in dogs with heart failure.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Hypotension, hypovolaemia.

**Adverse reactions:** Hypotension (reduce dose) and tachycardia. Tachyphylaxis can occur. Headaches are common in humans and may be an adverse effect in animals also.

**Drug interactions:** Concurrent use of ACE inhibitors, anaesthetics, beta-blockers, calcium-channel blockers, corticosteroids and diuretics may enhance the hypotensive effect. NSAIDs may antagonize effects.
Ispaghula (Psyllium) (Isogel*, Ispagel*, Regulan*) GSL

Formulations: Oral: granules, powder.

Action: Bulk-forming agent that increases faecal mass and stimulates peristalsis. Moderately fermentable in the colon and the resultant volatile fatty acids exert an osmotic laxative effect.

Use: Management of impacted anal sacs, diarrhoea and constipation, and the control of stool consistency after surgery. Available preparations for humans and are often fruit-flavoured and may be effervescent when mixed with water. They can be added to food for animals.

Safety and handling: Normal precautions should be observed.

Contraindications: Bowel obstruction.

Adverse reactions: Constipation or, if excess is given, diarrhoea and bloating may occur.

Drug interactions: No information available.

DOSES

Dogs: Dosages are empirical; none have been defined in dogs; initially 1-2 teaspoons with meals.

Cats: Dosages are empirical; none have been defined in cats; initially 1/2-1 teaspoonful with meals.

Small mammals, Birds, Reptiles: No information available.

Itraconazole (Itrafungol, Sporanox*) POM

Formulations: Oral: 100 mg capsule, 10 mg/ml oral solution.

Action: Triazole antifungal agent that inhibits the cytochrome systems involved in the synthesis of ergosterol in fungal cell membranes, causing increased cell wall permeability and allowing leakage of cellular contents.

Use: Treatment of aspergillosis, candidiasis, blastomycosis, coccidiodymycosis, cryptococcosis, histoplasmosis and dermatophytosis. Itraconazole has been used successfully to treat ringworm in Persian cats without the need for clipping. It is widely distributed in the body, although low concentrations are found in tissues with low protein contents, e.g. CSF, ocular fluid and saliva. Antacids, omeprazole, H2 antagonists and adsorbents may reduce the absorption of itraconazole. Plasma concentration of digoxin may be increased by itraconazole.
Safety and handling: Normal precautions should be observed.

Contraindications: Pregnancy. Avoid use if liver disease is present. It is not well tolerated by Grey Parrots and the lowest dose should be used at the longest interval and with great care if no alternative is available.

Adverse reactions: Anorexia, nausea, abdominal pain and hepatic toxicosis. Drug eruption, ulcerative dermatitis and limb oedema have been reported. It has a narrow safety margin in birds and should be discontinued if emesis or anorexia occurs.

Drug interactions: In humans antifungal imidazoles and triazoles inhibit the metabolism of antihistamines (particularly terfenadine), oral hypoglycaemics, antiepileptics, cisapride and ciclosporin. The significance in veterinary species has not been studied.

DOSES

Dogs, Cats: 5 mg/kg p.o. q24h. 4-20 weeks of treatment may be needed, dependent upon culture results.

Small mammals: Ferrets: dermatophytosis: 15 mg/kg p.o q24h or 25-33 mg/ferret p.o. q24h; Rabbits: dermatophytosis: 10 mg/kg p.o. q24h for 15 days; pulmonary aspergillosis: 20-40 mg/kg p.o. q24h; Guinea pigs: 5 mg/kg p.o. q24h.

Birds:
- Aspergillosis treatment: 5-10 mg/kg p.o. q12-24. Grey Parrots: use with great care and only at lowest dose and longest interval; Raptors: higher doses of up to 20 mg/kg p.o. q12-24h may be used.
- Aspergillosis prophylaxis: 10-20 mg/kg p.o. q24h in susceptible species (e.g. Gyrs (and their hybrids), Goshawks, Snowy Owls, Golden Eagles) during stressful events (e.g. manning) where drug therapy should be started 5 days before the stressful event starts.

Reptiles: 23.5 mg/kg p.o. q24h for 3d (spiny lizard pharmacokinetic study maintained systemic itraconazole levels for a further 6 days); 1.5 mg/kg p.o. q36h (fungal granuloma corn snake) for minimum 4 weeks; 5mg/kg p.o. q24h (panther chameleon fungal periodontal osteomyelitis).

Ivermectin (Animec, Bimectin, Qualimintic, Ivomec, Panomec,Virbamec, Xeno 450, Xeno 50-mini) POM-VPS, SAES

Formulations: Injectable: 1% w/v solution. Topical: 100 µg/g, 800 µg/g spot-on tubes.

Action: Interacts with GABA and glutamate-gated channels leading to flaccid paralysis of parasites.

Use: Treatment of dogs with generalized demodicosis, sarcoptic acariasis or cheyletiellosis, and cats with cheyletiellosis or otoacariasis when approved treatments have failed or cannot be employed. Prevention and treatment of internal and external parasites in small mammals and birds.
Safety and handling: Normal precautions should be observed. Contraindications: Administration to collies and related breeds is not recommended. Consider multiple drug resistance gene (MDR-1) testing in these breeds before use. Highly toxic to aquatic organisms. Do not use in chelonians. Adverse reactions: Neurotoxicity may be seen if it crosses mammalian blood-brain barrier. Dose adjustments may be required when administered concurrently with other therapeutic agents transported by P-glycoprotein. Drug interactions: No information available.

DOSES

Dogs:
- Sarcoptic mange: 200-400 µg/kg p.o., s.c. q2w for 4-6 weeks.
- Cheyletiellosis: 200-300 µg/kg p.o., s.c. q1-2w for 6-8 weeks.
- Generalized demodicosis: 300-600 µg/kg p.o., s.c. daily.

Cats: Otoacarasis (*Otodectes cynotis* infestation): 1% w/v ivermectin diluted 1:9 with propylene glycol topically (in affected ears) 1 drop daily for 21 days.

Small mammals: 0.2-0.5 mg/kg s.c., p.o. q7-14d; Ferrets, Rabbits, Guinea pigs: apply 450 µg/kg (1 tube Xeno 450) topically; Ferrets, small rodents <800 g: 50 µg/250g (15 drops Xeno 50-mini) q7-14d.

Birds: 200 µg/kg i.m., s.c., p.o. q7-14d; Raptors: capillariasis: 0.5-1 mg/kg i.m., p.o. q7-14d; *Serratospiculum*: 1 mg/kg p.o., i.m. q7-14d (moxidectin or doramectin may be given at same dose rates); Passerines and small psittacids: systemic dosing as above or 0.2 mg/kg applied topically to skin using 0.02% solution (in propylene glycol) q7-14d; Pigeons: 0.5 ml applied topically to bare skin using 0.02% solution q7-14d.

Reptiles: 0.2 mg/kg s.c., p.o. once, repeat in 10-14 days until negative for parasites; may use as environmental control for snake mites (*Ophionyssus natricis*) at dilution of 5 mg/l water sprayed in tank q7-10d (if pre-mix ivermectin with propylene glycol this facilitates mixing with water); Chelonians: do not use.

Kaolin (BCK, Kaobiotic, Kaogel VP) AVM-GSL

Formulations: Oral: BCK: granules containing 39.2 mg/g bismuth subnitrate + 49 mg/g calcium phosphate + 400 mg/g charcoal + 422 mg/g kaolin; Kaobiotic: tablet containing 729 mg kaolin + 5.96 mg neomycin; Kaogel VP: aqueous suspension containing Kaolin Light. Combination products with pectin, magnesium trisilicate, aluminium hydroxide and phosphate, bismuth salts, calcium carbonate or tincture of morphine are often available.

Action: Adsorbent anti diarrhoeal agent with possible antisecretory effect.
**Use:** Treatment of diarrhoea of non-specific origins in cats and dogs. BCK may be useful in the management of flatulent diarrhoea and acute poisoning. Although stool consistency may improve, studies do not show that fluid balance is corrected or that the duration of morbidity is shortened.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Intestinal obstruction or perforation. There is a danger of neomycin absorption and toxicity if mucosal ulceration is present. Do not use neomycin-containing preparations in haemorrhagic gastroenteritis.

**Adverse reactions:** See Neomycin monograph.

**Drug interactions:** May decrease the absorption of lincomycin, trimethoprim and sulphonamides.

**DOSES**

**Dogs, Cats:** BCK: 5-15 ml p.o. q8-12h. Kaobiotic: 1 tablet per 4 kg body weight p.o. q6-8h. Kaogel VP: 0.5-1.0 ml/kg p.o. as a total daily dose q6-8h.

**Small mammals:** No information available.

**Birds:** Kaolin/pectin mixture: 15 ml/kg p.o. once.

**Reptiles:** No information available.

---

**Ketamine** (Ketaset injection, Vetalar-V, Narketan-10) POM-V CD

**Schedule 4**

**Formulations:** Injectable: 100 mg/ml solution.

**Action:** Antagonizes the excitatory neurotransmitter glutamate at \( \text{N-methyl-D-aspartate (NMDA)} \) receptors in the CNS. It interacts with opioid receptors in a complex fashion, antagonizing OP3 receptors, whilst showing agonist actions at OP1 and OP2 receptors. It does not interact with GABA receptors.

**Use:** Provision of chemical restraint or dissociative anaesthesia. Ketamine also provides profound visceral and somatic analgesia and inhibits central sensitization through NMDA receptor blockade. It is used to provide perioperative analgesia as an adjunctive agent. Dissociative anaesthesia is associated with mild stimulation of cardiac output and blood pressure, modest respiratory depression and the preservation of cranial nerve reflexes. For example, the eyes remain open during anaesthesia and should be protected using a bland ophthalmic ointment. Used alone ketamine causes skeletal muscle hypertonicity and movement may occur that is unrelated to surgical stimulation. These effects are normally controlled by the co-administration of alpha-2 agonists and or benzodiazepines. When ketamine is combined with alpha-2 agonists (such as medetomidine) reversal of the alpha-2 agonist should be delayed until 45 min after ketamine administration. See Sedation protocols in Appendix.

**Safety and handling:** Normal precautions should be observed.
Contraindications: The use of ketamine in animals with raised intraocular pressure is not currently recommended.

Adverse reactions: Cardiovascular depression, rather than stimulation, and arrhythmias may arise in animals with a high sympathetic nervous system tone (e.g. animals in shock or severe cardiovascular disease). Tachycardias can also arise after administration of high doses i.v. Respiratory depression may be marked in some animals. Ketamine may result in spacey, abnormal behaviour for 1-2 hours during recovery. Prolonged administration of ketamine by infusion may result in drug accumulation and prolong recovery.

Drug interactions: No information available.

DOSES

Dogs:

- Perioperative analgesia: Intraoperatively: 10 µg/kg/min, postoperatively: 2-5 µg/kg/min, both preceded by a 0.25 mg/kg loading dose.
- Induction of anaesthesia (combined with diazepam or midazolam) as part of a volatile anaesthetic technique: 2 mg/kg i.v.
- Induction of general anaesthesia combined with medetomidine to provide a total injectable combination: 5-7 mg/kg ketamine combined with 40 µg/kg medetomidine.

Cats:

- Chemical restraint: 5 mg/kg ketamine combined with 0.2 mg/kg midazolam or diazepam i.m.; 10 mg/kg ketamine combined with a benzodiazepine will provide a short period of general anaesthesia.
- Combinations of ketamine (5-7.5 µg/kg) combined with medetomidine (80 µg/kg) i.m. will provide 20-30 min general anaesthesia. Reduce the doses of both drugs when given i.v.
- Doses for provision of perioperative analgesia are the same as those for dogs.

Small mammals:

- Ferrets: 10-30 mg/kg i.m., s.c alone gives immobilization and some analgesia; may be administered at 10-25 mg/kg with xylazine 1-2 mg/kg i.m. or at 25 mg/kg with diazepam 2-3 mg/kg i.m., i.p. or at 5-8 mg/kg with medetomidine 0.1 mg/kg i.m., s.c with or without butorphanol for general anaesthesia. Rabbits: 15-30 mg/kg i.m., s.c alone gives moderate to heavy sedation with some analgesia. May be administered at 35 mg/kg with xylazine 5 mg/kg i.m. or at 25 mg/kg with diazepam 5 mg/kg i.m., i.p. or at 15 mg/kg with medetomidine 0.25mg/kg i.m., s.c with or without butorphanol 0.4 mg/kg i.m., s.c for general anaesthesia; Guinea pigs: 60 mg/kg i.p.; Hamsters: 200 mg/kg i.p.; Rats, Mice: 87 mg/kg i.p; Others: 40-50 mg/kg i.m. May be administered with xylazine 2-5 mg/kg i.m. or 10 mg/kg i.p. or diazepam 2.5 mg/kg i.m., i.p. or medetomidine 0.25-0.5 mg/kg i.m., i.p., s.c. or fentanyl 0.05 mg/kg i.p., s.c.

Birds: Largely superceded by gaseous anaesthesia.

Reptiles: Chelonians: 20-60 mg/kg i.m., i.v.; Lizards: 25-60 mg/kg i.m., i.v.; Snakes: 20-80 mg/kg i.m., i.v.
**Ketoconazole** (Nizoral®) POM  

**Formulations:** Oral: 200 mg tablet.

**Action:** Broad spectrum imidazole that inhibits the cytochrome systems involved in the synthesis of ergosterol in fungal cell membranes, causing increased cell wall permeability and allowing leakage of cellular contents. It also inhibits the synthesis of cortisol in mammalian adrenal glands.

**Use:** Treatment of aspergillosis, candidiasis, blastomycosis, coccidioidomycosis, cryptococcosis, sporotrichosis and dermatophytosis. Medical management of adrenal tumours; short-term test therapy to provide evidence for or against a diagnosis of hyperadrenocorticism in animals with vague test results, as a primary therapy in dogs that do not tolerate mitotane or trilostane and in cats. In combination with ciclosporin to reduce the dose of ciclosporin required. The absorption of ketoconazole may be impaired by drugs that increase the pH of gastric contents, e.g. antacids, antimuscarinics and H2 blockers; stagger dosing of these drugs around ketoconazole dose. Ketoconazole extends the activity of methylprednisolone. In humans, antifungal imidazoles and triazoles inhibit the metabolism of antihistamines, oral hypoglycaemics and antiepileptics. Concomitant use of ketoconazole is likely to increase blood levels of ciclosporin.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Hepatotoxicity (not recognized in the dog unless high doses are used but routine monitoring of liver function tests is recommended), anorexia, vomiting and alterations in hair coat colour. Ketoconazole possibly has teratogenic effects. Cataract development has been associated with ketoconazole use in dogs. May be hepatotoxic and cause vomition in birds.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:**

- Antifungal therapy: 5-10 mg/kg p.o. q8-12h after meals. Several months of treatment may be required depending on the organism and site of infection. Doses up to 40 mg/kg/day are recommended to treat CNS or nasal infections (often in conjunction with amphotericin B); ketoconazole does not attain therapeutic levels in the CNS at ‘normal’ doses.

- Hyperadrenocorticism: 5 mg/kg p.o. q12h for 7 days, increasing to 10 mg/kg p.o. q12h for 14 days if no adverse effects seen. Perform an ACTH stimulation test after 14 days and if there is inadequate suppression increase the dose to 15-30 mg/kg p.o. q12h.

**Small mammals:** Ferrets: 10-50 mg/kg p.o. q12-24h; Rabbits: 10-40 mg/kg/day p.o for 14 days; Rodents: 10-40 mg/kg q24h p.o. for 14 days.

**Birds:** 25-30 mg/kg p.o., i.m. q12h.

**Reptiles:** 15-30 mg/kg p.o. q24h for 2-4 weeks.
**Ketoprofen** (Ketofen) POM-V

**Formulations:** Injectable: 1% solution. Oral: 5 mg, 20 mg tablets.

**Action:** COX-1 inhibition reduces the production of prostaglandins, while lipoxygenase enzyme inhibition has a potent effect on the vascular and cellular phases of inflammation. It has antipyretic, analgesic and anti-inflammatory effects.

**Use:** Relief of acute pain from musculoskeletal disorders and other painful disorders in the dog and cat. Management of chronic pain from osteoarthritis in the dog. Ketoprofen is not COX-2 selective and is not authorized for preoperative administration to cats and dogs. Do not administer perioperatively until the animal is fully recovered from anaesthesia and normotensive. Liver disease will prolong the metabolism of ketoprofen, leading to the potential for drug accumulation and overdose with repeated dosing. Accurate dosing of ketoprofen in cats is essential.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Administration of ketoprofen to animals with renal disease must be carefully evaluated. Do not give to pregnant animals or animals <6 weeks of age.

**Adverse reactions:** GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

**Drug interactions:** Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

**DOSES**

**Dogs:** 2 mg/kg s.c., i.m., i.v. q24h, may be repeated for up to 3 consecutive days; 0.25 mg/kg p.o. q24h for up to 30 days in total or 1 mg/kg p.o. q24h for up to 5 days.

**Cats:** 2 mg/kg s.c., i.m., i.v. q24h, may be repeated for up to 3 consecutive days; 1 mg/kg p.o. q24h for up to 5 days.

**Small mammals:** Rabbits: 1-3 mg/kg i.m., s.c. q24h; Hamsters, Gerbils, Rats: Up to 5 mg/kg p.o., i.m., s.c. q24h; Other rodents: 1-3 mg/kg s.c., i.m. q12-24h.

**Birds:** 1-5 mg/kg i.m. q8-24h.

**Reptiles:** No information available.

**Ketorolac** (Acular*) POM

**Formulations:** Ophthalmic: 0.5% drops in 5 ml bottle.

**Action:** COX inhibitor that reduces the production of prostaglandins and therefore reduces inflammation.
Use: Treatment of anterior uveitis and ulcerative keratitis when topical corticosteroids are contraindicated. Topical NSAIDs have the potential to increase intraocular pressure and should be used with caution in dogs predisposed to glaucoma.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: As with other topical NSAIDs, ketorolac trometamol may cause local irritation. Topical NSAIDs can be used in ulcerative keratitis but with caution as they can delay epithelial healing. Topical NSAIDs have been associated with an increased risk of corneal ‘melting’ (keratomalacia) in humans, although this has not been reported in the veterinary literature. Regular monitoring is advised.

Drug interactions: Ophthalmic NSAIDs may be used safely with other ophthalmic pharmaceuticals although concurrent use of drugs which adversely affect the corneal epithelium (e.g. gentamicin) may lead to increased corneal penetration of the NSAID. The concurrent use of topical NSAIDs with topical corticosteroids has been identified as a risk factor in humans for precipitating corneal problems.

DOSES
Dogs, Cats, Small mammals: 1 drop per eye q6-24h depending on severity of inflammation.

Birds: 1 drop per eye q12h.

Reptiles: No information available.

Lactulose (Lactugal*, Lactulose*) P

Formulations: Oral: 3.1-3.7 g/5 ml lactulose in a syrup base.

Action: Metabolized by colonic bacteria resulting in the formation of low-molecular weight organic acids (lactic, formic, acetic acids). These acids increase osmotic pressure, causing a laxative effect, acidifying colonic contents and thereby trapping ammonia as ammonium ions, which are then expelled with the faeces.

Use: Used to reduce blood ammonia levels in patients with hepatic encephalopathy and to treat constipation in dogs, cats and other species. Cats do not like the taste of lactulose.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not administer orally to severely encephalopathic animals at risk of inhalation.

Adverse reactions: Excessive doses cause flatulence, diarrhoea, cramping and dehydration. Reduce the dose if diarrhoea develops.

Drug interactions: Synergy may occur when lactulose is used with oral antibiotics (e.g. neomycin). Do not use lactulose with other laxatives.

Lactated Ringer’s solution see Appendix p.370
DOSES

Dogs:
- Constipation: 5-25 ml p.o. q8h. Monitor and adjust therapy to produce two or three soft stools per day.
- Acute hepatic encephalopathy: 18-20 ml/kg of a solution comprising 3 parts lactulose to 7 parts water per rectum as a retention enema for 4-8h.

Cats: 0.5-5 ml p.o. q8-12h.

Small mammals: Ferrets: 0.15-0.75 ml/kg p.o. q12h.

Birds: Appetite stimulant, hepatic encephalopathy: 0.2-1 ml/kg p.o. q8-12h.

Reptiles: 0.5 ml/kg p.o. q24h.

Latanoprost (Xalatan*) POM

Formulations: Ophthalmic: 50 µg/ml (0.005%) solution in 2.5 ml bottle.

Action: Agonist for receptors specific for prostaglandin-F. It reduces intraocular pressure by increasing uveoscleral outflow.

Use: Management of primary canine glaucoma and is useful in the emergency management of acute primary glaucoma (superceding mannitol). May have a profound effect on intraocular pressure in the dog. Its effect in the cat is less predictable and should be avoided in this species. Often used in conjunction with other topical antiglaucoma drugs such as carbonic anhydrase inhibitors. Latanoprost may be useful in the management of lens subluxation despite being contraindicated in anterior lens luxation. Latanoprost has comparable activity to travatoprost.

Safety and handling: Store in refrigerator until opened (then at room temperature).

Contraindications: Uveitis and anterior lens luxation (due to the marked miosis).

Adverse reactions: Miosis in dogs and cats; conjunctival hyperaemia and mild irritation may develop. Increased iridal pigmentation has been noted in humans but not in dogs.

Drug interactions: Do not use in conjunction with thiomersal-containing preparations.

DOSES

Dogs: 1 drop per eye once daily (best given in the evening) or q12h.

Cats: Do not use.

Small mammals, Birds, Reptiles: No information available.
**Leflunomide** (Arava*) POM

**Formulations:** Oral: 10 mg, 20 mg, 100 mg tablets.

**Action:** Inhibits dihydroorotate dehydrogenase, an enzyme involved in *de novo* pathway of pyrimidine synthesis.

**Use:** Treatment of active rheumatoid arthritis in humans. In veterinary medicine it has been reported to be effective in treatment of systemic histiocytosis and has also been used in canine immune-mediated diseases that are refractory to standard therapies. Clinical veterinary experience of this drug is limited.

**Safety and handling:** Disposable gloves should be worn to handle or administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

**Contraindications:** Bone marrow suppression, pre-existing infections, liver dysfunction.

**Adverse reactions:** Anorexia, lethargy, anaemia and haematemesis. In humans leflunomide can cause severe hepatotoxicity, myelosuppression and interstitial lung disease.

**Drug interactions:** In humans live virus vaccines, tolbutamide, rifampin, isoniazid and warfarin should not be given concomitantly.

**DOSES**

*Dogs:* 4 mg/kg p.o. q24h.

*Cats, Small mammals, Birds, Reptiles:* No information available.

---

**Lenograstim (rhG-CSF)** (Granocyte*) POM

**Formulations:** Injectable: 33.6 million IU (263 µg) vial for reconstitution.

**Use:** In humans it is indicated in the management of neutropenia. Neutrophil counts rise within 24 hours. Following discontinuation, neutrophil counts drop to normal after 5 days. There are few reports on the use of G-CSF in dogs and cats. It is most likely to be used in the management of febrile patients with neutrophil counts <1x10⁹/l.

See Appendix for conversion of body weight to surface area.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Concurrent administration with chemotherapy may increase incidence of adverse effects. G-CSF should be given at least 24 hours after the last dose of chemotherapy as the stimulatory effects of G-CSF on haemopoietic precursors renders then more susceptible.

**Adverse reactions:** Normal dogs produce neutralizing antibodies to rhG-CSF. This limits repeated use and may result in neutropenia.
This does not appear to be the case in canine chemotherapy patients. A variety of adverse effects have been reported in humans, including musculoskeletal pain, transient hypotension, dysuria, allergic reactions, proteinuria, haematuria and increased liver enzymes. Reported adverse effects are bone pain at high doses and irritation at the injection site.

**Drug interactions:** In humans steroids and lithium may potentiate the release of neutrophils during G-CSF therapy.

**DOSES**

**Dogs:** 19.2 million IU/m² i.v. (over 30 min), s.c. q24h for 3-5 days.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Levetiracetam** (S-Etiracetam, Levetirasetam) (Keppra*, Levron*, Kopodex*, Levroxa*) POM

**Formulations:** Oral: 250 mg, 500 mg and 750 mg tablets; 100 mg/ml solution.

**Action:** The mechanism of anticonvulsant action is unknown.

**Use:** Treatment of epilepsy in humans. In veterinary patients efficacy has been shown mainly as adjunctive therapy in the treatment of seizures refractory to treatment with phenobarbital and/or potassium bromide. Levetiracetam is an analogue of piracetam with a structure different to all other current anticonvulsants. Levetiracetum does not demonstrate affinity for receptors or electrolyte channels or messengers systems to which other antiepileptic drugs bind. Levetiracetam is rapidly absorbed from the GI tract with peak plasma concentrations reached in <2 hours of oral dosing. Steady state is rapidly achieved within 2 days. Plasma protein binding is minimal. The plasma half-life is short, being around 7 hours in human patients. Information on this drug is limited and relevant specialist literature should be consulted before using this drug. As with other antiepileptics, withdrawal of levetiracetam therapy or transition to or from another type of antiepileptic therapy should be made gradually to avoid precipitating an increase in the frequency of seizures.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Use with caution and in reduced doses in patients with renal and severe hepatic impairment. No dose adjustment is needed in patients with mild to moderate hepatic impairment. In patients with severe hepatic impairment, creatinine clearance may underestimate concomitant renal impairment.

**Adverse reactions:** The most commonly reported adverse effects reported in humans are sedation, weakness and dizziness. Blood dyscrasias such as neutropenia, pancytopenia and thrombocytopenia may also develop. In one canine study the only adverse effect reported was sedation in one of the 14 dogs in the study.
**Drug interactions:** Minimal, although there is some evidence to suggest that enzyme-inducing anticonvulsants (including phenobarbital, phenytoin and primidone) may modestly reduce levetiracetam levels, but not by clinically relevant amounts.

**DOSES**

**Dogs:** 5-30 mg/kg p.o. q8-12h.

**Cats:** 10-20 mg/kg p.o. q12h.

**Small mammals, Birds, Reptiles:** No information available.

---

**Levothyroxine** (T4, L-Thyroxine) (Thyroxyl) POM-V

**Formulations:** Oral: 0.1 mg, 0.2 mg, 0.3 mg, 0.5 mg, 0.8 mg tablets.

**Action:** Binds to specific intracellular receptors and alters gene expression.

**Use:** Treatment of hypothyroidism. In birds it is used to induce moult. Cases of pre-existing cardiac disorders require lower doses initially.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Uncorrected adrenal insufficiency.

**Adverse reactions:** Clinical signs of overdosage include tachycardia, excitability, nervousness and excessive panting. Can unmask Addison’s disease in patients with autoimmune polyglandular syndrome. May cause feather dystrophy if moult induced too quickly in birds.

**Drug interactions:** The actions of catecholamines and sympathomimetics are enhanced by thyroxine. Thyroid hormones increase the catabolism of vitamin K-dependent clotting factors, thereby potentiating the anticoagulant effects of warfarin. Diabetic patients receiving thyroid hormones may have altered insulin requirements; monitor carefully during the initiation of therapy. Oestrogens may increase thyroid requirements by increasing thyroxine-binding globulin. The therapeutic effect of digoxin and digitoxin may be reduced by thyroid hormones. Tachycardia and hypertension may develop when ketamine is given to patients receiving thyroid hormones. In addition many drugs may affect thyroid function tests and therefore monitoring of therapy.

**DOSES**

**Dogs, Cats:** 0.02-0.04 mg/kg/day. Alternatively dose at 0.5 mg/m² body surface area daily (see Appendix for conversion table). Dose once or divided twice a day according to response. Monitor serum T4 levels pre-dosing and 4-8 hours after dosing.

**Small mammals:** No information available.

**Birds:** 0.02 mg/kg p.o. q12-24h. Dissolve 1 mg in 28.4 ml water and give 0.4-0.5 ml/kg q12-24h.

**Reptiles:** 0.02 mg/kg p.o. q24h.
**Lidocaine (Lignocaine)** (Intubeaze, Lignol, Locovetic, Locaine, Lignadrin, EMLA) POM-V

**Formulations:** Injectable: 2% (20 mg/ml) solution (some contain adrenaline). Topical: 2% solution (Intubeaze), 4% solution (Xylocaine); 2.5% cream (EMLA).

**Action:** Local anaesthetic action is dependent on reversible blockade of the Na+ channel, preventing propagation of an action potential along the nerve fibre. Sensory nerve fibres are blocked before motor nerve fibres, allowing a selective sensory blockade at low doses. Lidocaine also has class 1b antiarrhythmic actions, decreasing the rate of ventricular firing, action potential duration and absolute refractory period, and increasing relative refractory period. Lidocaine has a rapid onset of action and intermediate duration of action. Addition of noradrenaline to lidocaine increases the duration of action by reducing the rate of systemic absorption.

**Use:** Provision of local or regional analgesia using perineural, infiltration, local i.v. or extradural techniques. Lidocaine is also used to provide systemic analgesia when given i.v. by continuous rate infusion. It is used in the management of ventricular tachyarrhythmias. It is widely used topically to desensitize mucous membranes (such as the larynx prior to intubation). EMLA cream is a mixture of lidocaine and prilocaine that is used to anaesthetize the skin before vascular cannulation. The cream must be placed on the skin for approximately 45-60 min to ensure adequate anaesthesia, covering the skin with an occlusive dressing promotes absorption. EMLA is very useful to facilitate venous catheter placement in the ears of conscious rabbits and small puppies and kittens. Infusions of lidocaine reduce the inhaled concentrations of anaesthetic required to produce anaesthesia and prevent central sensitization to surgical noxious stimuli. Systemic lidocaine is best used in combination with other analgesic drugs to achieve balanced analgesia. Lidocaine will accumulate after prolonged administration, leading to a delayed recovery. Cats are very sensitive to the toxic effects of local anaesthetics, therefore it is important that doses are calculated and administered accurately.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not give to cats by continuous rate infusion during the perioperative period. Do not give lidocaine solutions containing adrenaline i.v. Do not use solutions containing adrenaline for complete ring block of an extremity because of the danger of ischaemic necrosis. Do not use preparations with adrenaline in birds.

**Adverse reactions:** Depression, seizures, muscle fasciculations, vomiting, bradycardia and hypotension. If reactions are severe, decrease or discontinue administration. Seizures may be controlled with i.v. diazepam or pentobarbital. Monitor the ECG carefully during therapy. Cats tend to be more sensitive to the CNS effects. The CFC propellant used in aerosol preparations (Xylocaine spray) is alleged to have caused laryngeal oedema in cats.
Drug interactions: Cimetidine and propanolol may prolong serum lidocaine clearance if administered concurrently. Procainamide administered with lidocaine may cause additive CNS effects. Other antiarrhythmics may cause increased myocardial depression.

DOSES

Dogs:
- Local anaesthesia: Apply to the affected area with a small gauge needle to an appropriate volume. Total dose that should be injected is 4 mg/kg.
- Oesophagitis: 2 mg/kg p.o. q4-6h.
- Topical: Apply thick layer of cream to the skin and cover with a bandage for 45–60 min prior to venepuncture.
- Intraoperative analgesia given by constant rate infusion: 1 mg/kg loading dose (given slowly) followed by 20-40 µg/kg/min. Postoperatively use a dose in the low end of the dose range and adjust according to pain assessment.
- Ventricular arrhythmias: 2-8 mg/kg i.v. in 2 mg/kg boluses followed by a constant rate i.v. infusion of 0.025-0.1 mg/kg/min.

Cats:
- Local anaesthesia, topical, oesophagitis: Doses as for dogs.
- Ventricular arrhythmias: 0.25-1.0 mg/kg i.v. slowly followed by a constant rate i.v. infusion of 0.01-0.04 mg/kg/min.

Small mammals: Local anaesthesia: apply to the affected area with a small gauge needle to an appropriate volume. Total dose that should be injected is 1-3 mg/kg; doses greater than 4 mg/kg should not be used.

Birds: Less than 4 mg/kg as local infusion/nerve block. Do not use preparations with adrenaline.

Reptiles: Local infiltration s.c. to effect. Dilute 1:1 with sterile water prior to injection in small species and do not exceed 5 mg/kg total dose per animal due to cardiotoxic side effects.

Lignocaine see Lidocaine

Lincomycin (Lincocin) POM-V

Formulations: Injectable: 100 mg/ml solution for i.v. or i.m. use. Oral: 100 mg, 500 mg tablets.

Action: Inhibition of bacterial protein synthesis. It is bacteriostatic or bactericidal, depending on the organism and drug concentration. Being a weak base, it is ion-trapped in fluid that is more acidic than plasma and therefore concentrates in prostatic fluid, milk and intracellular fluid.
Use: Active against Gram-positive coccii (including penicillin-resistant staphylococci) and many obligate anaerobes. The lincosamides (lincomycin and clindamycin) are particularly indicated for staphylococcal bone and joint infections. Clindamycin is more active than lincomycin, particularly against obligate anaerobes, and is better absorbed from the gut. Administer lincomycin on an empty stomach. Administer slowly if using i.v. route.

Safety and handling: Normal precautions should be observed.

Contraindications: Rapid i.v. administration should be avoided since this can result in collapse due to cardiac depression and peripheral neuromuscular blockade. Do not use lincosamides in rabbits, guinea pigs, chinchillas and hamsters (death can occur due to overgrowth of toxin-producing strains of Clostridium).

Adverse reactions: Human patients on lincomycin may develop colitis. Although not a major veterinary problem, patients developing diarrhoea (particularly if it is haemorrhagic) whilst taking the medication should be monitored carefully. Toxicity is a possibility in patients with liver disease; weigh the risk versus the potential benefits before use of this drug in such patients.

Drug interactions: The action of neuromuscular blocking agents may be enhanced if given with lincomycin. The absorption of lincomycin may be reduced by kaolin. Lincosamide antimicrobials should not be used in combination with chloramphenicols or macrolides as these combinations are antagonistic.

DOSES

Dogs, Cats: Parenteral: 22 mg/kg i.m. q24h or 11 mg/kg i.m. q12h or 11-22 mg/kg slow i.v. q12-24h. Oral: 22 mg/kg p.o. q12h or 15 mg/kg p.o. q8h.

Small mammals: Ferrets: 11 mg/kg p.o. q8h; Rabbits, Chinchillas, Guinea pigs, Hamsters: do not use.

Birds: 50-75 mg/kg p.o., i.m. q12h. Pigeons: Lincomycin/spectinomycin preparation: 500-750 mg combined activity/l water.

Reptiles: 5 mg/kg i.m. q12-24h.

Liothyronine (T3, l-Tri-iodothyronine) (Tertroxin*) POM

Formulations: Oral: 20 µg tablets.

Action: Increases T3 concentrations.

Use: Treatment of hypothyroidism where levothyroxine has been unsuccessful, and in the diagnosis of feline hyperthyroidism (T3 suppression test).

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.
Adverse reactions: Signs of overdosage include tachycardia, excitability, nervousness and excessive panting.

Drug interactions: The actions of catecholamines and sympathomimetics are enhanced by thyroxine. Thyroid hormones increase the catabolism of vitamin K-dependent clotting factors, thereby potentiating the anticoagulant effects of warfarin. Diabetic patients receiving thyroid hormones may have altered insulin requirements; monitor carefully during the initiation of therapy. Oestrogens may increase thyroid requirements by increasing thyroxine-binding globulin. The therapeutic effect of digoxin and digitoxin may be reduced by thyroid hormones. Tachycardia and hypertension may develop when ketamine is given to patients receiving thyroid hormones. In addition many drugs may affect thyroid function tests and therefore monitoring of therapy.

DOSES

Dogs: Treatment of hypothyroidism: 2-6 µg/kg p.o. q8-12h.
Cats: T3 suppression test: Administer 20 µg p.o. q8h for 7 doses.
Small mammals, Birds, Reptiles: No information available.

Lipid infusions (Intralipid (10%, 20%, 30%)*), Ivelip (10%, 20%)*, Lipofundin (10%, 20%)*) POM

Formulations: Injectable: 10% solution contains soya oil emulsion, glycerol, purified egg phospholipids and phosphate (15 mmol/l) for i.v. use only. Contains 2 kcal/ml (8.4 kJ/ml), 268 mOsm/l. Other human products available and vary in composition.

Action: Support intermediary metabolism, reverse negative energy balance and provide some essential fatty acids.

Use: Used parenterally in animals receiving nutritional support, to provide fat for energy production and essential fatty acids for cellular metabolism and support of the immune system. Lipid emulsions are isosmolar with plasma and can be infused into a peripheral vein to provide parenteral nutrition. Due to the complex requirements of providing i.v. nutrition, including careful patient monitoring and the need for strict aseptic practice, in all cases product literature and specialist advice should be consulted. See also Amino acid solutions and Glucose.

Safety and handling: Do not use if separation of the emulsion occurs.

Contraindications: Insulin resistance (e.g. diabetes mellitus) and hyperlipidaemia. Use with caution in patients with known insulin resistance or at risk for developing pancreatitis.

Adverse reactions: Reactions include occasional febrile episodes mainly seen with 20% emulsions. 20% and 30% lipid products have a higher rate of complications including vasculitis, thrombosis, fever and other metabolic complications and are not recommended. Rare anaphylactic responses are reported in humans. Early reports of
hepatic failure, pancreatitis, cardiac arrest and thrombocytopenia detailed in human literature appear to have been complications of prolonged treatment.

**Drug interactions:** Consult specific product data sheet(s). Lines for i.v. parenteral feeding (lipid, glucose, amino acids or nutrient admixtures) should be dedicated for that use alone and should not be used for administration of other medications. Interference with biochemical measurements, such as those for blood gases and calcium, may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives may only be mixed with fat emulsions where compatibility is known. See Amino acid solutions for additional information.

**DOSES**

**Dogs:** The amount required will be governed by the patient’s physiological status and whether partial or total parenteral nutrition is provided. Generally lipid infusions are used to supply 30% (partial peripheral) to 40-60% of energy requirements.

**Cats:** The amount required will be governed by the patient’s physiological status and its tolerance of lipids. Generally peripheral parenteral nutrition is provided by amino acids in cats and lipids are used as an energy source in a nutrient admixture for infusion through central venous access (total parenteral nutrition) to supply 40-60% of energy requirements.

**Small mammals, Birds, Reptiles:** No information available.

**Lithium carbonate** (Camcolit*, Liskonum*, Priadel*) POM

**Formulations:** Oral: 250 mg, 400 mg tablets.

**Action:** Stimulates bone marrow stem cells, causing an increase in the production of haemopoietic cell lines, particularly granulocytes.

**Use:** Treatment of idiopathic aplastic anaemia, cytotoxic drug-induced neutropenia or thrombocytopenia, oestrogen-induced bone marrow suppression or cyclic haemopoiesis. There is a lag phase of up to 4 weeks before its effects may be seen. Experimental studies show that lithium may prevent neutropenia associated with cytotoxic drugs when administered concomitantly; clinical trials showing this are lacking. The recommended serum lithium concentration is 0.5-1.8 mmol/l; assess every 3 months if possible.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid the use of lithium in patients with renal impairment (nephrotoxic at high doses), cardiac disease and conditions with sodium imbalance (e.g. hypoadrenocorticism). Do not use in cats.

**Adverse reactions:** Nausea, diarrhoea, muscle weakness, fatigue, polyuria and polydipsia. The release of T3 and T4 may be blocked by lithium; assess thyroid status every 6 months. Lithium is toxic to cats.
Drug interactions: The excretion of lithium may be reduced by ACE inhibitors, loop diuretics, NSAIDs and thiazides, thus increasing the risk of toxicity. Lithium toxicity is made worse by sodium depletion; avoid concurrent use with diuretics. The excretion of lithium may be increased by theophylline. Lithium antagonizes the effects of neostigmine and pyridostigmine. Neurotoxicity may occur if lithium is administered with diltiazem or verapamil.

DOSES
Dogs: 11 mg/kg p.o. q12h.
Cats: Do not use.
Small mammals, Birds, Reptiles: No information available.

**Liquid paraffin** see Paraffin

**Lomustine (CCNU) (Lomustine*) POM**

Formulations: Oral: 40 mg capsule.

Action: Interferes with the synthesis and function of DNA, RNA and proteins. Antitumour activity correlates best with formation of interstrand crosslinking of DNA. Lomustine is highly lipid-soluble, allowing rapid transport across the blood-brain barrier.

Use: Treatment of primary and metastatic brain tumours in humans. Its use in animals is less well defined but has been reported to have some efficacy in the treatment of metastatic mast cell tumours, refractory lymphoma, histiocytic sarcoma and epitheliotrophic lymphoma. See Appendix for body weight to surface area conversion table.

Safety and handling: Disposable gloves should be worn to handle/administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

Contraindications: Bone marrow suppression.

Adverse reactions: Myelosuppression is the dose-limiting toxicity, with neutropenia developing 7 days after administration. Neutropenia may be severe and life-threatening at the higher end of the dose range in some dogs. GI and hepatic toxicity have been reported in the dog.

Drug interactions: Lomustine requires hepatic microsomal enzyme hydroxylation for the production of antineoplastic metabolites. It should be used with caution in dogs being treated with agents that induce liver enzyme activity, e.g. phenobarbital. In humans cimetidine enhances the toxicity of lomustine.

DOSES
Dogs: 50-90 mg/m² p.o. q21d.
Cats: A dose of 60 mg/m² p.o. q21d has been suggested but is not well established. If using this drug in the cat, specialist advise should be sought prior to its use.

Small mammals, Birds, Reptiles: No information available.

Loperamide (Diarese*, Imodium*, Loperamide* Norimode*) P, GSL

Formulations: Oral: 2 mg capsule (Imodium, Loperamide, Norimode); 0.2 mg/ml syrup (Diarese, Diocalm).

Action: Opioid agonist that alters GI motility by acting on receptors in the myenteric plexus. It normally has no central action.

Use: Management of non-specific acute and chronic diarrhoea, and irritable bowel syndrome.

Safety and handling: Normal precautions should be observed.

Contraindications: Intestinal obstruction.

Adverse reactions: Do not use in dogs likely to be ivermectin-sensitive, e.g. collies. The mutation of the multiple drug resistance (MDR) gene in these dogs allows loperamide (a P-glycoprotein substrate) to penetrate the CNS and cause profound sedation. Use with care in cats as excitability may be seen. Constipation will occur in some cases.

Drug interactions: No information available.

DOSES

Dogs, Cats: 0.04-0.2 mg/kg p.o. q8-12h.

Small mammals, Birds, Reptiles: No information available.

Loratadine (Loratadine*) GSL

Formulations: Oral: 10 mg tablet; 1 mg/ml syrup.

Action: Binds to H1 histamine receptors preventing histamine from binding. May reduce seizure threshold.

Use: Management of allergic disease. Specific doses for dogs and cats have not been determined by pharmokinetic studies.

Safety and handling: Normal precautions should be observed.

Contraindications: Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction.

Adverse reactions: May cause mild sedation.

Drug interactions: No information available.

DOSES

Dogs: 5-15 mg q24h.

Cats, Small mammals, Birds, Reptiles: No information available.
**Lorazepam** (Ativan*) POM

**Formulations:** Oral: 1 mg tablets. Injectable: 4mg/ml solution.

**Action:** Increases the activity of GABA (a major inhibitory transmitter) within the CNS, resulting in anxiolysis.

**Use:** Short term management of anxiety disorders in dogs and cats. This may be necessary during a long-term behavioural therapy programme to avoid relapses due to exposure to an intensely fear-inducing stimulus during treatment. However, as benzodiazepines may inhibit memory, their routine use as part of a behaviour plan is not recommended. Withdrawal of treatment should be gradual, as acute withdrawal may result in signs of tremor and inappetence.

**Contraindications:** Glaucoma, significant liver or kidney disease, hypersensitivity to benzodiazepines. Not recommended in pregnant or lactating animals.

**Adverse reactions:** A general concern with benzodiazepines concerns disinhibition and the subsequent emergence of aggression. Drowsiness and mild transient incoordination may develop.

**Drug interactions:** Caution is advised if used in association with antifungals such as ketoconazole which inhibit its metabolism.

**DOSES**

**Dogs, Cats:** 0.02-0.1 mg/kg p.o. q12-24h; start at lower dose and gradually increase.

**Small mammals, Birds, Reptiles:** No information available.

---

**Lufenuron** (Program, Program plus) POM-V

**Formulations:** Oral: 23.1 mg, 67.8 mg, 204.9 mg, 409.8 mg tablets (Program); 2.3 mg/46 mg, 5.75 mg/115 mg, 11.5 mg/230 mg, 23 mg/460 mg milbemycin/lufenuron tablets (Program plus); 133 mg, 266 mg suspension. Injectable: 10% w/v (100mg/ml) suspension.

**Action:** Inhibition of chitin synthetase leads to a failure of chitin production which means that flea eggs fail to hatch.

**Use:** Prevention of flea infestation (*Ctenocephalides felis, C. canis*). For treatment of flea infestations the additional use of an approved adulticide is recommended. All animals in the household should be treated. Lufenuron has an additional antifungal action but specific doses for the effective treatment of dermatophytosis are currently unknown. Can be used in pregnant and lactating females.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 10 mg/kg p.o., s.c. q1month.

**Cats:** 10 mg/kg s.c. q6months or 30 mg/kg p.o. q1month.
**Small mammals:** Ferrets: 30-45 mg/kg p.o. q1month.

**Birds, Reptiles:** No information available.

**Lysine (L-Lysine) (Lysine*) GSL**

**Formulations:** Oral: 250 mg, 500 mg tablets.

**Action:** Antagonizes arginine, which is required for viral replication.

**Use:** Management of human herpes simplex and has been used in the management of feline herpesvirus infection. Dietary lysine supplementation is used in an attempt to suppress FHV-1 infection and reactivation. However, there is limited clinical evidence regarding its efficacy in treating FHV-1.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Do not use preparations containing propylene glycol as they may be toxic to cats. Diarrhoea may be seen. Cats are very sensitive to arginine deficiency and dietary arginine must not be reduced.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** Not applicable.

**Cats:** 250-500 mg p.o. q12-24h.

**Small mammals, Birds, Reptiles:** No information available.

**Magnesium salts** (Magnesium sulphate injection BP(Vet) 25% w/v) POM-VPS, POM

**Formulations:** Injectable: 25% w/v, 50% w/v solutions containing 1 mEq and 2 mEq magnesium per ml. Dilute to a 20% or lower solution prior to use.

**Action:** Critical role in muscular excitement and neurological transmission. It is a cofactor in a variety of enzyme systems and maintenance of ionic gradients.

**Use:** Emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may be present), in humans. In animals magnesium salts have been used to treat unresponsive ventricular dysrhythmias, as a chemical defibrillator and in the management of severe hypotension. Reduce i.v. potassium supplementation to avoid hyperkalaemia. Monitoring of serum magnesium is essential, 30-35% is bound to protein and the remainder is free as the ionized form. Magnesium is compatible in solution with 5% dextrose and calcium gluconate. Treatment of potential overdose or complications should be anticipated and ventilatory support and i.v. calcium gluconate may be required. Product information should be consulted on an individual case basis.
Safety and handling: Normal precautions should be observed.

Contraindications: Do not use in patients with heart block or myocardial damage. Renal impairment or failure since magnesium is excreted by the kidneys at a rate proportional to serum levels.

Adverse reactions: Somnolence, CNS depression and possibly coma, muscular weakness, bradycardia, hypotension, respiratory depression and prolonged Q-T intervals have been seen, typically following overdosage. Very high levels can cause neuromuscular blockade and cardiac arrest.

Drug interactions: Additive effects can be seen with other CNS depressants including barbiturates and general anesthetics. Do not use with non-depolarizing neuromuscular blocking agents because of the risk of severe neuromuscular blockage. Because serious conduction disturbances can occur use with extreme caution with digitalis glycosides.

DOSES

Dogs, Cats:
- Life-threatening ventricular arrhythmia: 0.15-0.3 mEq/kg i.v. administered over 5-15 min.
- Magnesium replacement: 0.75-1.0 mEq/kg/day by continuous rate infusion in 5% dextrose has been advocated for the first 24-48 hours, followed by a lower dose of 0.3-0.5 mEq/kg/day for 3-5 days to allow complete repletion of magnesium stores.

Small mammals, Birds, Reptiles: No information available.

Mannitol (Cordycepic acid) (Mannitol*) POM

Formulations: Injectable: 10%, 20% solutions.

Action: Raises the osmotic pressure of the plasma, drawing water out of body tissues and producing an osmotic diuresis. Although mannitol is an isomer of sorbitol, it has little energy value as it is almost completely eliminated before any metabolism can take place.

Use: Reduction of CSF and intraocular fluid pressure which occurs within 15 minutes of the start of a mannitol infusion and lasts for 3-8 hours after the infusion is discontinued; diuresis occurs after 1-3 hours. A 5.07% solution in water is iso-osmotic with serum. Mannitol should never be added to whole blood for transfusion or given through the same set by which blood is being infused. It is recommended that an in-line i.v. filter be used when infusing concentrated mannitol. Do not add KCl or NaCl to concentrated mannitol solutions (20% or 25%) as a precipitate may form.

Safety and handling: Any crystals that have formed during storage should be dissolved by warming prior to use. The formation of crystals is a particular problem with the 20% and 25% formulations, which are supersaturated.

Contraindications: Intracranial haemorrhage (except during intracranial surgery), severe congestive heart failure, pulmonary oedema or anuric renal failure (before rehydration).
**Adverse reactions:** The most common adverse reactions seen are fluid and electrolyte imbalances. Infusion of high doses may result in circulatory overload and acidosis. Thrombophlebitis may occur and extravasation of the solution may cause oedema and skin necrosis. Mannitol causes diarrhoea if given orally. Rarely mannitol may cause acute renal failure in human patients.

**Drug interactions:** Diuretic-induced hypokalaemia may occur when ACE inhibitors are used with potassium-depleting diuretics. Concurrent use of potassium-depleting diuretics should be used with care in conjunction with beta-blockers. Nephrotoxicity has been described with concurrent use of mannitol and ciclosporin in human patients.

**DOSES**

**Dogs, Cats:**
- Acute glaucoma or acute cerebral oedema: 1-2 g/kg i.v. infusion over 30 min. Withhold water for the first few hours after administering. May repeat 2-4 times over next 48 hours; monitor for dehydration.
- Early oliguric renal failure (as an alternative to using furosemide and dopamine): 0.25-0.5 g/kg i.v. infusion over 5-10 min. Rehydrate the patient prior to the use of mannitol.

**Small mammals, Birds, Reptiles:** No information available.

---

**Marbofloxacin** (Aurizon, Marbocyl) POM-V

**Formulations:** Injectable: 200 mg powder for reconstitution giving 10 mg/ml when reconstituted. Oral: 5 mg, 20 mg, 80 mg tablets. Topical: Compound preparation containing 3 mg/ml of marbocyl along with clotrimazole and dexamethasone (aural use).

**Action:** Broad spectrum bactericidal antibiotic inhibiting bacterial DNA gyrase. The bactericidal effect is concentration-dependent particularly against Gram-negative bacteria, meaning that pulse-dosing regimens may be effective. Low urinary pH may reduce the activity.

**Use:** Active against mycoplasmas and many Gram-positive and particularly Gram-negative organisms, including *Pasteurella* spp., *Staphylococcus* spp., *Pseudomonas aeruginosa*, *Klebsiella* spp., *Escherichia coli*, *Proteus* spp. and *Salmonella* spp. Fluoroquinolones are effective against beta-lactamase-producing bacteria. Marbofloxacin is relatively ineffective in treating obligate anaerobic infections. Fluoroquinolones are highly lipophilic drugs that attain high concentrations within cells in many tissues and are particularly effective in the management of soft tissue, urogenital (including prostatitis) and skin infections.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Cartilage abnormalities have been reported following the use of other fluoroquinolones in growing animals. Such abnormalities have not been specifically reported following the use of
marbofloxacin, but the drug is not authorized for use in dogs <12 months of age and cats <16 weeks. In giant breeds should not be administered to animals <18 months. The 20 mg and 80 mg tablets should not be administered to cats.

**Adverse reactions:** Some animals show GI signs (nausea, vomiting). Use with caution in epileptics until further information is available, as fluoroquinolones potentiate CNS adverse effects when administered concurrently with NSAIDs in humans. High doses of enrofloxacin have resulted in reports of retinal blindness in cats. Although not reported with marbofloxacin, caution should be exercised before using dose rates above those recommended by the manufacturer for cats.

**Drug interactions:** Adsorbents and antacids containing cations (Mg$^{2+}$, Al$^{3+}$) may bind to fluoroquinolones, preventing their absorption from the GI tract. The absorption of fluoroquinolones may be inhibited by sucralfate and zinc salts; doses should be at least 2 hours apart. Enrofloxacin increases plasma theophylline concentrations. Preliminary data suggest this may not be clinically significant with marbofloxacin unless used in patients with renal insufficiency. Cimetidine may reduce the clearance of fluoroquinolones and should be used with caution in combination.

**DOSES**

**Dogs:** Oral and parenteral: 2 mg/kg i.v., s.c., p.o. q24h. Topical: 10 drops per ear once daily.

**Cats:** 2 mg/kg i.v., s.c., p.o. q24h.

**Small mammals:** 2-5 mg/kg p.o., s.c., i.m. q24 h.

**Birds:** 10 mg/kg p.o., i.m., i.v q24h.

**Reptiles:** 10 mg/kg s.c., i.m., p.o. q48h.

**Maropitant** (Cerenia) POM-V

**Formulations:** Injectable: 10 mg/ml solution. Oral: 16 mg, 24 mg, 60 mg, 160 mg tablets.

**Action:** Inhibits vomiting reflex by blocking NK-1 receptors in medullary vomiting centre. A high degree of protein binding gives a long duration of activity (24 hours). Maropitant is not known to have any prokinetic effect.

**Use:** Treatment and prevention of vomiting in dogs, including that caused by chemotherapy and motion sickness. There have been no studies in feline clinical patients. However, the manufacturer has conducted a number of studies on cats from which it can be concluded that maropitant is well tolerated and has potent antiemetic activity in cats. In cases of frequent vomiting, treatment by injection is recommended. Treatment by injection and/or tablets can be given for up to 5 days. If used chronically, a rest period of 2 days after every 5 doses is suggested. In some individual dogs, repeat treatment at a lower dose may be adequate. Maropitant is more effective if used
pre-emptively for chemotherapy-induced emesis, but should be given at least 1 hour in advance, and may even be given the night before. For motion sickness, treatment for up to 2 days can be given. If longer periods of treatment are required the recommended interval between the last dose of one course and the first dose of a subsequent course is 72 hours. In situations where a GI prokinetic effect is desired, or in species where maropitant is not authorized and safety data are lacking, the use of metoclopramide may be justified under the Cascade.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No specific contraindications but it would be sensible not to use maropitant where GI obstruction or perforation is present or for longer than 48 hours without a definitive diagnosis. It should be used in combination with investigation into the cause of vomiting and with other supportive measures and specific treatments.

**Adverse reactions:** Transient pain reaction during injection is reported as a rare occurrence, but no significant lasting adverse reactions. Very high doses in cats may cause haemolysis.

**Drug interactions:** No compatibility studies exist, and therefore the injection should not be mixed with any other agent.

**DOSES**

**Dogs:** 1 mg/kg s.c. q24h or 2 mg/kg p.o. q24h. For prevention of motion sickness, tablets at a dose rate of 8 mg/kg q24h for a maximum of 2 days are indicated.

**Cats:** Not authorized. However, 0.5-1 mg/kg p.o., s.c. q24h is likely to be effective in reducing emesis from 2 to 24 hours after dosing. Tolerance has been demonstrated at 5 mg/kg s.c. q24h for a maximum of 15 days.

**Small mammals, Birds, Reptiles:** No information available.

---

**Mebendazole** (Telmin) NFA-VPS

**Formulations:** Oral: 100 mg/g granules (Telmin); 20 mg/ml suspension (Vermox).

**Action:** Inhibits fumarate reductase system of parasites thereby blocking the citric acid cycle and also reduces glucose absorption by the parasite.

**Use:** Treatment of *Toxocara canis*, *T. cati*, *Toxascaris leonina*, *Trichuris vulpis*, *Ucnicaria stenocephala*, *Ancylostoma caninum*, *Taenia pisiformis*, *T. hydatigena*, *Echinococcus granulosus* and *Taeniaformis hydatigena*. Other similar authorized drugs should be used first in cats and dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** May cause diarrhoea. Hepatotoxicity is reported.

**Drug interactions:** No information available.
DOSES

Dog, Cats:
- Ascarids: 50 mg p.o. q12h (<2 kg) for 2 consecutive days; 100 mg p.o. q12h (>2 kg) for 2 consecutive days.
- Other helminths: 50 mg p.o. q12h (<2 kg) for 5 days; 100 mg p.o. q12h (2-30 kg) for 5 consecutive days; 200 mg p.o. q12h (>30 kg) for 5 consecutive days.

Small mammals: 50 mg/kg p.o. q12h for 2 consecutive days;
Rabbits: 10 mg/kg p.o. q24h for 5 days. Rats, Mice (pinworms): 40 mg/kg p.o. q7d for 3 doses.

Birds, Reptiles: No information available.

Medetomidine (Domitor, Dorbene, Sedator) POM-V

Formulations: Injectable: 1 mg/ml solution.

Action: Agonist at peripheral and central alpha-2 adrenoreceptors producing dose-dependent sedation, muscle relaxation and analgesia.

Use: Provides sedation and premedication when used alone or in combination with opioid analgesics. Medetomidine combined with ketamine is used to provide a short duration (20-30 min) of surgical anaesthesia. Specificity for the alpha-2 receptor is greater for medetomidine when compared with xylazine and romifidine.

Medetomidine is a potent drug that causes marked changes in the cardiovascular system including an initial peripheral vasoconstriction that results in an increase in blood pressure and a compensatory bradycardia. After 20-30 min vasoconstriction wanes, while blood pressure returns to normal values. Heart rate remains low due to the central sympatholytic effect of alpha-2 agonists. These cardiovascular changes result in a fall in cardiac output, central organ perfusion is well maintained at the expense of redistribution of blood flow away from the peripheral tissues. Respiratory system function is well maintained after medetomidine, respiration rate may fall but is accompanied by an increased depth of respiration. Oxygen supplementation is advisable in all animals that have received medetomidine for sedation, as with other sedative protocols. The duration of analgesia from a 10 µg/kg dose of medetomidine is approximately 1 hour. Combining medetomidine with an opioid provides improved analgesia and sedation. Lower doses of medetomidine should be used in combination with other drugs.

Reversal of medetomidine sedation or premedication with atipamezole at the end of the procedure shortens the recovery period. Analgesia should be provided with other classes of drugs before atipamezole.

The authorized dose range of medetomidine for dogs and cats is very broad. High doses (>20 µg/kg) are associated with greater physiological disturbances than doses between 5-20 µg/kg. Using medetomidine in combination with other drugs in the lower dose range can provide good sedation and analgesia with minimal side effects.
Safety and handling: Normal precautions should be observed.

Contraindications: Do not use in animals with cardiovascular or other systemic disease. Use of medetomidine in geriatric patients is not advisable. It should not be used in pregnant animals, nor in animals likely to require or receiving sympathomimetic amines.

Adverse reactions: Medetomidine has diverse effects on many organ systems as well as the cardiovascular system. It causes a diuresis by suppressing ADH secretion, a transient increase in blood glucose by decreasing endogenous insulin secretion, mydriasis and decreased intraocular pressure. Vomiting after i.m. administration is common, therefore medetomidine should be avoided when vomiting is contraindicated. Use in diabetic animals is not recommended due to the effects on blood glucose. Spontaneous arousal from deep sedation following stimulation can occur with all alpha-2 agonists; aggressive animals sedated with medetomidine must still be managed with caution.

Drug interactions: When used for premedication, medetomidine will significantly reduce the dose of all other anaesthetic agents required to maintain anaesthesia. Drugs for induction of anaesthesia should be given slowly and to effect to avoid inadvertent overdose, the dose of volatile agent required to maintain anaesthesia can be reduced by up to 70%.

DOSES

Dogs, Cats:
- Premedication: 10 µg/kg i.v., i.m., s.c. in combination with an opioid.
- Deep sedation: 20-30 µg/kg i.m. in combination with an opioid.

Small mammals: Ferrets: 0.08-0.2 mg/kg s.c., i.m.; use at 0.08 mg/kg with ketamine 5-8 mg/kg and/or butorphanol 0.1 mg/kg; Rabbits: 0.25-0.5 mg/kg s.c., i.m.; use lower dose when in combination with ketamine and/or butorphanol to 0.1-0.25 mg/kg; Other small mammals: 0.5 mg/kg i.m., i.p., s.c.

Birds: See Appendix for sedative combinations.

Reptiles: 100-200 µg/kg i.m.; may be combined with 5-10 mg/kg ketamine to provide light anaesthesia.

Medium chain triglycerides (MCT Oil, MCT Peptide) (Liquigen*) POM, GSL

Formulations: Oral: Each 15 ml of medium chain triglyceride (MCT) oil contains 115 kcal (7.7 kcal/ml). Several products are available and some human authorized products also contain peptides and simple sugars. A more palatable 50% emulsion is available (Liquigen), although the volume given must be doubled.

Action: Provision of energy-dense calories which circumvent some of the requirements for normal fat digestion and absorption.
Use: Treatment of steatorrhoea associated with exocrine pancreatic insufficiency or intestinal lymphangiectasia and other proven malabsorption syndromes. Used in a ketogenic diet in the management of epilepsy. MCTs are more easily hydrolyzed than most dietary fats and require less bile acids for absorption. MCTs were thought to be absorbed directly into the portal system and used as energy sources in animals requiring low-fat diets, e.g. hyperlipidaemia, lymphangiectasia. However, recent work indicates significant lymphatic transport. The use of MCTs have largely been supplanted with the development of advanced prescription diets which address the more global needs of patients with the above disorders. Mix with food to increase palatability.

Safety and handling: Light-sensitive; store in original brown glass container to preclude rancidity.

Contraindications: MCT oils should not be used in cats as they are largely derived from coconut oil and contain no essential fatty acids. Avoid in chronic hepatic diseases (e.g. cirrhosis, portocaval shunts).

Adverse reactions: MCT oils produce an unpleasant burning sensation in the oral mucosa and are not always readily palatable. Bloating, flatulence and diarrhoea have been reported in dogs and low doses should be used initially increasing with patient tolerance. They are rapidly absorbed and if there is significant hepatic inability for clearance high CSF levels can occur, resulting in or exacerbating hepatic encephalopathy and coma.

Drug interactions: Possible interference and reduction of absorption of fat-soluble drugs (e.g. griseofulvin and vitamins A, D, E and K).

DOSES

Dogs: 1-2 ml/kg (1/4-1/2 teaspoon) p.o. can be used to start and the total given should not exceed 20% of the animal’s daily energy intake. A gradual introduction is necessary as initial tolerance is poor. Cats: Do not use MCT oils.

Small mammals, Birds, Reptiles: No information available.

Medroxyprogesterone (Promone-E) POM-V

Formulations: Injectable: 50 mg/ml suspension. Oral: 5 mg tablet.

Action: Alters the transcription of DNA leading to alterations in cellular metabolism which mimic progesterone.

Use: Feline psychogenic alopecia, dermatitis and eosinophilic keratitis, to decrease libido in male dogs, to manage prostatic hypertrophy, and to control oestrus in the bitch and queen. It is used in birds to manage feather plucking. When used in the management of feline skin disease, ensure effective topical and environmental parasite controls are instituted before considering progestagen therapy. Because of adrenocortical suppression, rapid withdrawal of the drug without adequate glucocorticoid cover is not advisable.
Safety and handling: Normal precautions should be observed.

Contraindications: Use in the treatment of behavioural disorders in cats and dogs, and specifically of feline spraying, is not recommended; alternative treatments are available. Subcutaneous injections may cause a permanent local alopecia, skin atrophy and depigmentation. Do not use in pregnancy or diabetes mellitus.

Adverse reactions: Temperament changes (listlessness and depression), increased thirst or appetite, cystic endometrial hyperplasia/pyometra, diabetes mellitus, adrenocortical suppression, reduced libido (males), mammary enlargement/neoplasia and lactation. As progestogens may cause elevated levels of growth hormone in the dog, acromegaly may develop. There are many side effects in birds including liver damage, obesity and diabetes mellitus.

Drug interactions: No information available.

DOSES

Dogs:
• Prevention of oestrus in bitches: 12.5 mg/dog s.c. (<5 kg), 25 mg/dog s.c. (5-8 kg), 36 mg/dog s.c. (8-12 kg), 3 mg/kg s.c. (>12 kg). Inject 6-8 weeks before oestrus is due.
• Interruption of oestrus: Once pro-oestral bleeding has started, 10 mg/dog p.o. q24h for 4 days then 5 mg/dog p.o. q24h for 12 days. Use a doubled dose for bitches >15 kg.
• Prostatic hypertrophy: 50-100 mg/dog s.c. every 3-6 months.

Cats:
• Psychogenic dermatitis: 10 mg/kg s.c. q3months prn.
• Prevention of oestrus: 5 mg/cat/week commencing in dioestrus or anoestrus.

Small mammals: No information available.

Birds: Persistent ovulation, Feather plucking, Sexual behavioural problems: 5-50 mg/kg i.m. Repeat in 4-6 weeks if necessary.

Reptiles: No information available.

Megestrol (Megoestrol acetate) (Ovarid) POM-V

Formulations: Oral: 5 mg, 20 mg tablets.

Action: Alters the transcription of DNA, leading to alterations in cellular metabolism which mimic progesterone.

Use: Prevention and postponement of oestrus in the bitch and queen, the management of pseudopregnancy and oestrogen-dependent mammary tumours in the bitch, miliary dermatitis, eosinophilic granuloma and eosinophilic keratitis in the cat. When used in the management of feline skin disease, ensure effective topical and environmental parasite controls are instituted before considering progestagen therapy. Because of adrenocortical suppression, rapid withdrawal of the drug without adequate glucocorticoid cover is not advisable.
Safety and handling: Normal precautions should be observed.

Contraindications: Do not administer on more than 2 consecutive occasions or to animals with diabetes mellitus. Do not administer to bitches with reproductive tract disease, pregnancy or mammary tumours (unless oestrus-dependent). The use of progestogens in the management of behavioural disorders in cats and dogs is not recommended; alternative treatments are available.

Adverse reactions: Temperament changes (listlessness), increased thirst or appetite, cystic endometrial hyperplasia/pyometra, diabetes mellitus, adrenocortical suppression, mammary enlargement/neoplasia and lactation. As progestogens may cause elevated levels of growth hormone in the dog, acromegaly may develop.

Drug interactions: No information available.

DOSES

Dogs:
- Prevention of oestrus: begin during first 3 days of pro-oestrus at 2 mg/kg p.o. q24h for 8 days or 2 mg/kg p.o. q24h for 4 days followed by 0.5 mg/kg p.o. q24h for 16 days.
- Postponement of oestrus: 0.5 mg/kg p.o. q24h for a maximum of 40 days. Commence treatment preferably 14 days (minimum 7 days) before the effect is required.
- False pregnancy: 2 mg/kg p.o. q24h for 5-8 days commencing when signs of false pregnancy are first seen.
- Treatment of oestrogen-dependent mammary tumours: 2 mg/kg p.o. q24h for 10 days or 2 mg/kg p.o. q24h for 5 days, then 0.5-1 mg/kg p.o. q24h for 10 days.

Cats:
- Progestogen-responsive skin disorders (eosinophilic alopecia, granuloma, miliary dermatitis): 2.5-5 mg p.o. q48-72h until response and then reduce dose to 2.5-5 mg once a week.
- Prevention of oestrus: 2.5 mg/cat p.o. weekly for up to 30 weeks or 5 mg/cat p.o. for 3 days at signs of calling.

Small mammals, Birds, Reptiles: No information available.

Meglumine antimonate (Glucantime*) POM

Formulations: Injectable: 300 mg/ml solution.

Action: Reported to interfere with glucose metabolism of Leishmania parasites.

Use: Treatment of canine leishmaniasis. Intolerance is rare but it is recommended to start with half dosage and gradually increase to an effective dose. Animals may be clinically normal after treatment but remain carriers and follow-on treatment with allopurinol may be beneficial. It is advisable to consult specialist texts or seek expert advice when treating leishmaniasis.
Safety and handling: Normal precautions should be observed.
Contraindications: Do not use where severe liver or renal dysfunction exists.
Adverse reactions: No information available.
Drug interactions: No information available.

DOSES

**Dogs:** 100 mg/kg s.c., i.m., slow i.v. q24h until clinical remission achieved. Treat for 20 days, rest for 10-15 days, then treat for a further 10 days.

**Cats, Small mammals, Birds, Reptiles:** No information available.

Megoestrol see Megestrol

**Melatonin** *(Melatonin*, *Regulin*)

Formulations: Oral: 3 mg tablets.

Action: Hormone which is involved in the neuroendocrine control of seasonal hair loss.

Use: Treatment of hair cycling disorders in dogs; in particular the treatment of alopecia X and seasonal flank alopecia. A 4-6 week trial is recommended, if no growth is noted then treatment should be discontinued. For seasonal flank alopecia, treatment may have to be repeated the following year.

The effect of melatonin on hair re-growth in dogs with non-pruritic alopecia of unknown aetiology is variable and every effort should be made to identify the underlying disorder before starting this therapy. Oral bioavailability of melatonin in dogs is unknown. Also used for palliative treatment of adrenocortical disease in ferrets.

Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: No information available.
Drug interactions: No information available.

DOSES

**Dogs:** 3-6 mg q8h p.o.

**Cats:** No information available.

**Small mammals:** Ferrets: 0.5 mg p.o. q24h.

**Birds, Reptiles:** No information available.

**Meloxicam** *(Metacam, Flexicam, Meloxidyl)* POM-V

Formulations: Oral: 0.5 mg/ml suspension for cats, 1.5 mg/ml oral suspension for dogs; 1.0 mg, 2.5 mg tablets for dogs. Injectable: 5 mg/ml solution.
Action: Preferentially inhibits COX-2 enzyme thereby limiting the production of prostaglandins involved in inflammation.

Use: Alleviation of inflammation and pain in both acute and chronic musculoskeletal disorders and the reduction of postoperative pain and inflammation following orthopaedic and soft tissue surgery. All NSAIDs should be administered cautiously in the perioperative period as they may adversely affect renal perfusion during periods of hypotension. If hypotension during anaesthesia is anticipated, delay meloxicam administration until the animal is fully recovered from anaesthesia and normotensive. Liver disease will prolong the metabolism of meloxicam leading to the potential for drug accumulation and overdose with repeated dosing. The oral dose may be administered directly into the mouth or mixed with food. In the cat, due to the longer half-life and narrower therapeutic index of NSAIDs, particular care should be taken to ensure the accuracy of dosing and not to exceed the recommended dose.

Safety and handling: After first opening a bottle of oral suspension use contents within 6 months. Shake the bottle of the oral suspension well before dosing. The shelf-life of a broached bottle of injectable solution is 28 days.

Contraindications: Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Administration of meloxicam to animals with renal disease must be carefully evaluated and is not advisable in the perioperative period. Do not give to pregnant animals or animals <6 weeks of age.

Adverse reactions: GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2 week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

Drug interactions: Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES

Dogs: Initial dose is 0.2 mg/kg s.c. or p.o.; if given as a single preoperative injection effects last for 24 hours. Can be followed by a maintenance dose of 0.1 mg/kg p.o q24h.

Cats:
- Initial injectable dose is 0.3 mg/kg s.c.; if given as a single preoperative injection effects last for 24 hours. Continuation of treatment with the oral suspension after meloxicam injection is not currently recommended.
- Initial oral dose is 0.1 mg/kg p.o. q24h, which can be followed by a maintenance dose of 0.05 mg/kg p.o q24h.
Small mammals: Rabbits: 0.3-0.6 mg/kg s.c., p.o. q24h; studies have shown that rabbits may require a dose exceeding 0.3 mg/kg q24h to achieve optimal plasma levels of meloxicam over a 24-hour interval and doses of 1.5 mg/kg s.c., p.o. are well tolerated for 5 days; Rats: 1-2 mg/kg s.c., p.o. q24h; Mice: 2 mg/kg s.c. p.o. q24h.

 etter: 0.1-0.5 mg/kg i.m., p.o. q24h.

Reptiles: 0.2 mg/kg i.m., p.o. q24h.

**Melphalan** (Alkeran*) POM

Formulations: Oral: 2 mg tablet. Injection: 50 mg powder in vial plus diluent.

Action: Forms inter- and intrastrand crosslinks with DNA, resulting in inhibition of DNA synthesis and function.

Use: Treatment of multiple myeloma and may also be used as a substitute for cyclophosphamide in the treatment of canine lymphoma and in some rescue protocols for lymphoma. See Appendix for conversion of body weight to body surface area. Take care in dosing small dogs on m² basis as there is a risk of overdose due to the tablet sizes (tablets should not be split). Give tablets on an empty stomach.

Safety and handling: Disposable gloves should be worn to handle/administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

Contraindications: Bone marrow suppression.

Adverse reactions: Myelosuppression is dose-limiting toxicity with leucopenia, thrombocytopenia, effect may be prolonged and cumulative. GI adverse reactions include anorexia, nausea and vomiting.

Drug interactions: Cimetidine decreases the oral bioavailability of melphalan. Steroids enhance the antitumour effects of melphalan. In humans ciclosporin enhances the risk of renal toxicity.

**DOSES**

**Dogs, Cats:**
- Myeloma: 1-2 mg/m² p.o. q24h for 3-6 weeks then reduce gradually. Often used with prednisolone 40 mg/m² p.o. q24h for 7-14 days then 20 mg/m² p.o. q48h.
- Lymphoma: 5 mg/m² p.o. q48h or 20 mg/m² q14d.

**Small mammals, Birds, Reptiles:** No information available.

**Mepivacaine** (Intra-epicaine) POM-V

Formulations: Injectable: 2% solution.

Action: Local anaesthetic action is dependent on reversible blockade of the Na⁺ channel preventing propagation of an action potential.
along the nerve fibre. Sensory nerve fibres are blocked before motor nerve fibres, allowing a selective sensory blockade at low doses.

**Use:** Blockade of sensory nerves to produce analgesia following perineural or local infiltration. Instillation into joints to provide intra-articular analgesia. Mepivacaine has less intrinsic vasodilator activity than lidocaine and is thought to be less irritant to tissues. It is of equivalent potency to lidocaine but has a slightly longer duration of action.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Mepivacaine should not be injected i.v.

**Adverse reactions:** Inadvertent i.v. injection may cause convulsions and/or cardiac arrest.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Inject the minimal volume required to achieve an effect. Toxic doses of mepivacaine have not been established in companion animals.

**Small mammals, Birds, Reptiles:** No information available.

---

**Metaflumizone** (Promeris, Promeris Duo) POM-V

**Formulations:** Topical: 200 mg/ml spot-on pipettes of various sizes (Promeris); 150 mg/ml metaflumizone + 150 mg/ml amitraz in various sizes (Promeris Duo).

**Action:** Blocks sodium channels, causing flaccid paralysis of parasites.

**Use:** Treatment and prevention of flea infestations (*Ctenocephalides canis* and *C. felis*) in cats and dogs >8 weeks of age. The amitraz-containing product is additionally indicated for the treatment and prevention of tick infestations in dogs. For treatment of flea infestations the additional use of an insect growth regulator is recommended.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Safety has not been established in pregnant and lactating females. Promeris Duo should not be used in cats.

**Adverse reactions:** Hypersalivation may occur if the product is ingested. Sedation, bradycardia, respiratory and CNS depression with amitraz-containing product can be reversed with an alpha-2 agonist such as atipamezole or yohimbine.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 40 mg/kg applied topically every 4-6 weeks. Do not use Promeris Duo in cats.

**Small mammals, Birds, Reptiles:** No information available.
**Metamizole** *(Dipyrone)* *(Buscopan Compositum, Analgin, Tempalgin)* POM-V

**Formulations:** Injectable: 4 mg/ml butylscopolamine (q.v.) + 500 mg/ml metamizole *(Buscopan Compositum)*; 0.5 mg/ml solution *(Metamizole)*. Oral: 500 mg tablets.

**Action:** Anti-inflammatory effects, which are brought about by a reduction in prostaglandin production at the site of inflammation. It also has antipyretic and analgesic effects which occur through blocking the synthesis of endogenous pyrogens *(prostaglandins D and E)*.

**Use:** The combination of metamizole and butylscopolamine is indicated for the management of visceral pain, particularly spasmodic colic or pain from urinary obstruction. Metamizole is indicated in humans for the management of pain *(both chronic and acute postoperative pain)*, but it does not have a marketing authorization for animals in the UK.

**Safety and handling:** Avoid self-injection as metamizole can cause reversible but potentially serious agranulocytosis and skin allergies in humans.

**Contraindications:** No information available.

**Adverse reactions:** Hepatitis, nephropathy, blood dyscrasia and GI disturbances in common with other NSAIDs. Because of the seriousness of these side effects it should be used as a second line agent for the treatment of pyrexia and rarely as an anti-inflammatory.

**Drug interactions:** Metamizole should not be given to dogs that have been treated with a phenothiazine, as hypothermia may result.

**DOSES**

* **Dogs:** 0.1 mg/kg i.v., i.m q12h *(Buscopan Compositum)*.

* **Cats:** Not authorized; strongly discouraged.

* **Small mammals, Birds, Reptiles:** No information available.

**Methadone** *(Physeptone*, Methadone*) POM CD **SCHEDULE 2**

**Formulations:** Injectable: 10 mg/ml solution. Oral: 10 mg tablets.

**Action:** Analgesia mediated by the OP3 opioid receptor.

**Use:** Management of moderate to severe pain in the perioperative period. Incorporation into sedative and pre-anaesthetic medication protocols to provide improved sedation and analgesia. Methadone has similar pharmacological properties to morphine, and is useful in similar situations. It provides profound analgesia and appears to have a duration of action of 3-4 hours in dogs; however, there are limited pharmacokinetic and pharmacodynamic data in cats and dogs. Accumulation is likely to occur after prolonged repeated dosing which may allow the dose to be reduced or the dose interval extended. Methadone can be given i.v. without causing histamine release and does not cause vomiting when given to animals preoperatively.
Transient excitation may occur when methadone is given i.v. Oral methadone is rarely used in cats and dogs due to a high first pass metabolism leading to low plasma concentrations after administration.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In common with other OP3 agonists methadone can cause respiratory depression, although this is unlikely when used at clinical doses in conscious cats and dogs. Respiratory depression may occur when methadone is given i.v. during general anaesthesia due to the increased depth of anaesthesia that accompanies administration. Respiratory function should be monitored when given to anaesthetized patients. Vomiting is rare after methadone administration although it will cause constriction of GI sphincters (such as the pyloric sphincter) and may cause a reduction in GI motility when given over a long period. The response to all opioids appears to vary between individual patients, therefore assessment of pain after administration is imperative. Methadone is metabolized in the liver, some prolongation of effect may be seen with impaired liver function. Methadone crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Severe adverse effects can be treated with naloxone.

**Drug interactions:** Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillisers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics.

**DOSES**

**Dogs:** 0.1-0.5 mg/kg i.m. or 0.1 mg/kg i.v. prn.

**Cats:** 0.1-0.3 mg/kg i.v. slow, i.m., s.c.

**Small mammals, Birds, Reptiles:** No information available.

**Methenamine (Hexamine hippurate)** (Hiprex*) POM

**Formulations:** Oral: 150 mg methenamine + 116 mg monosodium phosphate tablet; 1 g methenamine hippurate (Hiprex) tablet.

**Action:** Urinary antiseptic.

**Use:** Long-term control of recurrent urinary tract infections. It should not be used alone as it is only bacteriostatic. It requires an acidic urine to be effective.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Severe renal impairment, dehydration and metabolic acidosis.

**Adverse reactions:** Methenamine may cause GI disturbances, bladder irritation or a rash.

**Drug interactions:** Efficacy is reduced when drugs that alkalinize urine (potassium citrate) are used concurrently.
DOSES

**Dogs:** 1-3 tablets p.o. q24h (methenamine/sodium acid phosphate) or 500 mg/dog p.o. q12h (methenamine).

**Cats:** 1 tablet p.o. q24h (methenamine/sodium acid phosphate) or 250 mg/cat p.o. q12h (methenamine).

**Small mammals, Birds, Reptiles:** No information available.

**Methimazole** (Felimazole) POM-V

**Formulations:** Oral: 2.5 mg, 5 mg tablet.

**Action:** Interferes with the synthesis of thyroid hormones by inhibiting peroxidase-catalysed reactions (blocks oxidation of iodide), the iodination of tyrosyl residues in thyroglobulin, and the coupling of mono- or di-iodotyrosines to form T3 and T4. There is no effect on iodine uptake and it does not inhibit peripheral de-iodination of T4 to T3.

**Use:** Control of thyroid hormone levels in cats with hyperthyroidism. It has also been used occasionally in dogs with hyperthyroidism. As a veterinary authorized product, methimazole has initially replaced carbimazole as the drug of choice for treatment of feline hyperthyroidism but a new veterinary authorized formulation of carbimazole is also now available. Two to three weeks of treatment are generally needed to establish euthyroidism. Monitor therapy on the basis of serum thyroxine concentrations (4-6 hours after dosing) and adjust dose accordingly for long-term medical management. Assess haematology, biochemistry and serum total T4 after 3, 6, 10 and 20 weeks and thereafter every 3 months, adjusting dosage as necessary.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in pregnant or lactating queens.

**Adverse reactions:** Vomiting and inappetence/anorexia may be seen and are often transient. Pruritus and haematological abnormalities (e.g. neutropenia) are seen. Occasional hepatopathies and immunological adverse effects (cytopenias, serum antinuclear antibodies) can be seen. Treatment of hyperthyroidism can decrease glomerular filtration rate, thereby raising serum urea and creatinine values, and occasionally unmask occult renal failure.

**Drug interactions:** Phenobarbital may reduce clinical efficacy. Benzimidazole drugs reduce hepatic oxidation and may lead to increased circulating drug concentrations.

**DOSES**

**Dogs:** 2.5-5 mg/dog p.o. q12h depending on size.

**Cats:** 2.5 mg/cat p.o. q12h.

**Small mammals, Birds:** No information available.

**Reptiles:** Snakes: 2 mg/kg p.o. q24h for 30 days.
Methionine (Methionine*) P

Formulations: Oral: 250 mg tablets.

Action: Urinary acidifier.

Use: Struvite urolithiasis. Paracetamol poisoning if given within 12 hours of ingestion. There is an increased risk of acidosis if used with other urinary acidifying treatments.

Safety and handling: Normal precautions should be observed.

Contraindications: Renal failure or severe hepatic disease. Young age.

Adverse reactions: Overdosage may lead to metabolic acidosis.

Drug interactions: No information available.

DOSES

Dogs:
- Urine acidification: 200 mg/dog to 1 g/dog p.o. q8h. Adjust the dose until urine pH is 6.5 or lower.
- Paracetamol poisoning: 2.5 g/dog p.o., followed by 3 further doses of 2.5 g/dog q4h.

Cats:
- Urine acidification: 200 mg/cat p.o. q8h. Adjust the dose until urine pH is 6.5 or lower.
- Paracetamol poisoning: 2.5 g/cat p.o., followed by 3 further doses of 2.5 g/cat q4h.

Small mammals, Birds, Reptiles: No information available.

Methocarbamol (Robaxin*) POM-V

Formulations: Oral: 500 mg, 750 mg tablets.

Action: Carbamate derivative of guaifenesin that is a CNS depressant with sedative and musculoskeletal relaxant properties. The mechanism of action has not been fully established, it has no direct action on the contractile mechanism of skeletal muscle, the motor endplate or the nerve fibre.

Use: Treatment of tetanus and some toxicities (e.g. strychnine) and as a general muscle relaxant for muscular spasms. The clearance of methocarbamol is significantly impaired in human patients with renal and hepatic disease. There is very limited literature on the use of methocarbamol in cats.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Salivation, emesis, lethargy, weakness and ataxia.

Drug interactions: As methocarbamol is a CNS depressant, additive depression may occur when given with other CNS depressant agents.
DOSES

**Dogs, Cats:** 20-45 mg/kg p.o. q8h. Very high doses may be required for tetanus. It is recommended that the dose does not exceed 330 mg/kg, although serious toxicity or death has not been reported after overdoses.

**Small mammals, Birds, Reptiles:** No information available.

**Methoprene** (S-Methoprene) (Frontline Combo, Acclaim spray, R.I.P fleas) NFA-VPS, GSL

**Formulations:** Topical: 10% w/v fipronil with S-methoprene spot-on pipettes in a wide range of sizes (Frontline). Environmental: S-methoprene and permethrin household spray (Acclaim).

**Action:** Juvenile hormone analogue that inhibits larval development.

**Use:** Treatment and prevention of flea infestations (*Ctenocephalides canis* and *C. felis*) and tick prevention in dogs and cats >8 weeks of age (dogs >2 kg; cats >1 kg). For treatment of flea infestations the product should be applied every 4 weeks to all in contact cats and dogs (Frontline Combo). Bathing 48 hours prior to and 24 hours after application is not recommended. Minimum treatment interval 4 weeks. Can be used in pregnant and lactating females. Treat infested household as directed with spray; keep away from birds (and fish).

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Should not be used in rabbits. May be harmful to aquatic organisms.

**Adverse reactions:** Local pruritus or alopecia may occur at the site of application.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 1 pipette per animal according to body weight. Cheyletiellosis, Otoacariasis (*Otodectes cynotis* infestation): two applications 4 weeks apart. Treatment of the environment is also recommended in cases of flea infestation.

**Small mammals:** Rabbits: do not use.

**Birds:** Do not use.

**Reptiles:** No information available.

**Methotrexate** (Methotrexate*, Matrex*) POM

**Formulations:** Oral: 2.5 mg, 10 mg tablets.

**Action:** Competitively inhibits folic acid reductase which is required for purine synthesis, DNA synthesis and cellular replication. This results in inhibition of DNA synthesis and function.
Use: Treatment of lymphoma, although its use in animals is often limited by toxicity. In humans it is used to treat refractory rheumatoid arthritis; however, data are lacking with regards to its use in canine/feline immune-mediated polyarthritides.

Safety and handling: Disposable gloves should be worn to handle/administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

Contraindications: No information available.

Adverse reactions: Particularly with high doses GI ulceration, mucositis, hepatotoxicity, nephrotoxicity and haemopoietic toxicity may be seen. Monitor haematological parameters regularly.

Drug interactions: Methotrexate is highly bound to serum albumin and thus may be displaced by phenylbutazone, phenytoin, salicylates, sulphonamides and tetracycline, resulting in increased blood levels and toxicity. Folic acid supplements may inhibit the response to methotrexate. Methotrexate increases the cytotoxicity of cytarabine. Cellular uptake is decreased by hydrocortisone, methylprednisolone and penicillins, and is increased by vincristine. Concurrent use of NSAIDs increases the risk of haematological, renal and hepatic toxicity.

DOSES

Dogs, Cats: 2.5-5 mg/m² p.o. twice weekly. Adjust the frequency of dosing according to toxic effects.

Small mammals, Birds, Reptiles: No information available.

Methylene blue see Methylthioninium chloride

Methylprednisolone (Depo-Medrone, Medrone, Solu-Medrone) POM-V

Formulations: Injectable: 40 mg/ml depot suspension (Methylprednisolone acetate, Depo-Medrone); 125 mg, 500 mg powder for reconstitution (Solu-Medrone). Oral: 2 mg, 4 mg tablets (Medrone).

Action: Alters the transcription of DNA leading to alterations in cellular metabolism which result in anti-inflammatory, immunosuppressive and antifibrotic effects. Also acts in dogs as an ADH antagonist.

Use: Anti-inflammatory agent and in the management of shock. Has 5 times the anti-inflammatory potency of hydrocortisone and 20% more potency than prednisolone. On a dose basis, 0.8 mg methylprednisolone is equivalent to 1 mg prednisolone. The oral formulation of methylprednisolone is suitable for alternate-day use.
The use of steroids in shock and acute spinal cord injury is controversial. The value of administering steroids declines rapidly after the onset of shock or injury, whilst the side effects remain constant. Doses should be tapered to the lowest effective dose. Animals on chronic therapy should be tapered off steroids when discontinuing the drug.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus.

**Adverse reactions:** Prolonged use of methylprednisolone suppresses the hypothalamic-pituitary axis and causes adrenal atrophy. Catabolic effects of glucocorticoids lead to weight loss and cutaneous atrophy. Iatrogenic hyperadrenocorticism may develop with long-term use. Vomiting and diarrhoea may be seen and GI ulceration may develop. Glucocorticoids may increase urine glucose levels and decrease serum T3 and T4. Impaired wound healing and delayed recovery from infections may be seen. Corticosteroids should be used with care in birds as there is a high risk of immunosuppression and side effects, such as hepatopathy and a diabetes mellitus-like syndrome.

**Drug interactions:** There is an increased risk of GI ulceration if used concurrently with NSAIDs. Hypokalaemia may develop if amphotericin B or potassium-depleting diuretics (furosemide, thiazides) are administered concomitantly with corticosteroids. Insulin requirements are likely to increase in patients taking glucocorticoids. The metabolism of corticosteroids may be enhanced by phenobarbital or phenytoin.

**DOSES**

**Dogs:**
- Inflammation: Initially 1.1 mg/kg i.m. (methylprednisolone acetate depot injection) q1-3wk or 0.2-0.5 mg/kg p.o. q12h.
- Immunosuppression: 1-3 mg/kg p.o. q12h reducing to 1-2 mg/kg p.o. q48h.
- CNS trauma: 30 mg/kg i.v. within 8 hours of trauma, followed by 15 mg/kg i.v. 2 hours and 6 hours later, followed by 2.5 mg/kg as an i.v. infusion for 48h.

**Cats:**
- Asthma: 1-2 mg/kg (depot injection) i.m. q1-3wk.
- Inflammation/flea allergy: 5 mg/kg i.m. (depot injection) every 2 months or 1 mg/kg p.o. q24h reducing to 2-5 mg/cat p.o. q48h.

**Small mammals, Birds:** No information available.

**Reptiles:** 5-10 mg/kg i.m. once.
**Methyltestosterone** (Orandrone, Sesoral) POM-V

**Formulations:** Oral: 5 mg methyltestosterone tablet (Orandrone); 4 mg methyltestosterone + 0.005 mg ethinylestradiol tablet (Sesoral).

**Action:** Binds to specific cytoplasmic receptors which then enter the nucleus and alter the transcription of DNA, leading to alterations in cellular metabolism which results in effects that mimic testosterone.

**Use:** Management of deficient sex drive in male animals, reversal of feminization in male dogs caused by the oestrogenic effects of testicular tumours (once the tumour has been removed), oestrogen-dependent mammary tumours, oestrus suppression in the bitch, false pregnancy in the bitch, testosterone-responsive incontinence in neutered male dogs and anaemia due to chronic renal failure. Its use has also been suggested for the management of feline endocrine alopecia, alopecia due to hypogonadism and senile alopecia in male dogs. Note that only the combined methyltestosterone and ethinylestradiol product (Sesoral) is authorized for use in the management of false pregnancy. Its value as a supportive anabolic agent in cases of debility or senile decline or in the management of anaemia is controversial.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Do not use if liver damage, renal damage or congestive heart failure is present. Avoid use in pregnant or breeding animals. Alopecia may develop in some cats. Methyltestosterone may cause increased serum creatinine levels and creatinine excretion.

**Drug interactions:** The insulin requirements in diabetic patients may be altered. Androgens suppress the activity of clotting factors II, V, VII and X, and thus increase the bleeding tendency in patients on anticoagulant therapy.

**DOSES**

**Dogs, Cats:** 0.5 mg/kg (to nearest 2.5 mg) p.o. q24h (Orandrone); 0.34 mg/kg p.o. then 0.17 mg/kg p.o. q12h for 5 days (Sesoral).

**Small mammals, Birds, Reptiles:** No information available.

**Methylthioninium chloride** (Methylene blue) (Methylthioninium chloride*) AVM-GSL

**Formulations:** Injectable: 10 mg/ml (1% solution).

**Action:** Acts as an electron donor to methaemoglobin reductase.

**Use:** Methaemoglobinaemia. Use an in-line filter if possible.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use unless adequate renal function is demonstrated.

**Adverse reactions:** Methylthioninium chloride may cause a Heinz body haemolytic anaemia and renal failure.

**Drug interactions:** No information available.
DOSES

**Dogs:** 1-10 mg/kg i.v. of a 1% solution slowly once.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Metoclopramide** (Maxolon®, Metoclopramide*) POM

**Formulations:** Injectable: 5 mg/ml solution in clear glass ampoules. Oral: 10 mg tablet; 15 mg capsule; 1 mg/ml syrup.

**Action:** Antiemetic and upper GI prokinetic stimulant; distal intestinal motility is not significantly affected. The antiemetic effect is a result of central dopamine (D2) receptor antagonism, and at higher doses 5HT3 antagonism, at the chemoreceptor trigger zone. The gastric prokinetic effect is a result of local D2 antagonism and stimulation of muscarinic acetylcholine and 5HT4 receptors leading to increases in oesophageal sphincter pressure, the tone and amplitude of gastric contractions and peristaltic activity in the duodenum and jejunum, and relaxing the pyloric sphincter by sensitizing tissues to acetylcholine. There is no effect on gastric, pancreatic or biliary secretions and nor does metoclopramide depend on an intact vagal innervation to affect motility.

**Use:** Vomiting of many causes can be reduced by this drug. The prokinetic effect may be beneficial in reflux oesophagitis and in emptying the stomach prior to induction of general anaesthesia. High doses are needed to abolish all reflux during anaesthesia. The prokinetic effect may also help to prevent postoperative ileus in rabbits; however, it is only effective in adult rabbits. Currently maropitant is the only antiemetic with a veterinary market authorization. However, in situations where a GI prokinetic effect is desired, or in species where maropitant is not authorized and safety data are lacking, use of metoclopramide may be justified.

**Safety and handling:** Injection is light-sensitive. Obscure fluid bag if used in a constant rate infusion.

**Contraindications:** Do not use metoclopramide where GI obstruction or perforation is present or for >72 hours without a definitive diagnosis. It is relatively contraindicated in epileptic patients.

**Adverse reactions:** Unusual, although more common in cats than dogs, and probably relate to relative overdosing and individual variations in bioavailability. They include changes in mentation (depression, nervousness, restlessness) and behaviour. It may also cause sedation and extrapyramidal effects (movement disorders characterized as slow to rapid twisting movements involving the face, neck, trunk or limbs). Cats may exhibit signs of frenzied behaviour or signs of disorientation. Metoclopramide reduces renal blood flow, which may exacerbate pre-existing renal disease.

**Drug interactions:** The activity of metoclopramide may be inhibited by antimuscarinic drugs (e.g. atropine) and narcotic analgesics. The effects of metoclopramide may decrease (e.g. cimetidine, digoxin) or
increase (e.g. oxytetracycline) drug absorption. The absorption of nutrients may be accelerated, thereby altering insulin requirements and/or timing of its effects in diabetics. Phenothiazines may potentiate the extrapyramidal effects of metoclopramide. The CNS effects of metoclopramide may be enhanced by narcotic analgesics or sedatives.

**DOSES**

**Dogs, Cats:** 0.2-0.5 mg/kg i.m., s.c., p.o. q6-8h or 1-2 mg/kg i.v. over 24 hours as a slow constant rate infusion.

**Small mammals:** Ferrets, Rabbits, Guinea pigs: 0.5-1 mg/kg s.c., p.o. q6-12h.

**Birds:** 0.3-2.0 mg/kg p.o., i.m. q8-24h.

**Reptiles:** 0.05-1 mg/kg p.o., i.m. q24h.

---

**Metronidazole** (Flagyl*, Metrolyl*, Metronidazole, Stomorgyl)

**POM-V, POM**

**Formulations:** Injectable: 5 mg/ml i.v. infusion. Oral: 200 mg, 400 mg, 500 mg tablets;

25 mg metronidazole + 46.9 mg spiramycin tablets, 125 mg metronidazole + 234.4 mg spiramycin tablets, 250 mg metronidazole + 469 mg spiramycin tablets (Stomorgyl); 40 mg/ml oral solution.

**Action:** Synthetic nitroimidazole with antibacterial and antiprotozoal activity. Its mechanism of action on protozoans is unknown but in bacteria it appears to be reduced spontaneously under anaerobic conditions to compounds that bind to DNA and cause cell death.

**Use:** Treatment of anaerobic infections, giardiasis and other protozoal infections, and in the management of hepatic encephalopathy. Metronidazole may have effects on the immune system by modulating cell-mediated immune responses. It is absorbed well from the GI tract and diffuses into many tissues including bone, CSF and abscesses. Spiramycin (a constituent of Stomorgyl) is active against Gram-positive aerobes including *Staphylococcus* spp., *Streptococcus* spp., *Bacillus* spp. and *Actinomyces* spp. Metronidazole has been used as an appetite stimulant in reptiles. In ferrets it is used in combination with amoxicillin, and bismuth subsalicylate, ranitidine or omeprazole (triple therapy) for treatment of *Helicobacter mustelae*. In rabbits it is the treatment of choice for enterotoxaemia due to *Clostridium spiroforme*. Metronidazole is frequently used in combination with penicillin or aminoglycoside antimicrobials to improve anaerobic spectrum. Some texts recommend doses in excess of 25 mg/kg. There is a greater risk of adverse effects with rapid i.v. infusion or high total doses. It is no longer used in dogs and cats for the treatment of giardiasis but may still have a role in chinchillas with this condition.

**Safety and handling:** Use gloves.
Contraindications: Do not administer to Indigo or King snakes due to toxicity. Do not use in very small birds, such as Zebra finches, due to toxicity. Use with caution in chinchillas as anecdotally it has been associated with liver failure.

Adverse reactions: Adverse effects in animals are uncommon and are generally limited to vomiting, CNS toxicity (nystagmus, ataxia, knuckling, head tilt and seizures), hepatotoxicity and haematuria. Excessive salivation /foaming is noted in some cats. Prolonged therapy or the presence of pre-existing hepatic disease may predispose to CNS toxicity. Use with caution in the first trimester of pregnancy as it may be teratogenic.

Drug interactions: The one-stage prothrombin (OSPT) time in patients on warfarin may be prolonged by metronidazole. Phenobarbital or phenytoin may enhance metabolism of metronidazole. Cimetidine may decrease the metabolism of metronidazole and increase the likelihood of dose-related adverse effects. Spiramycin should not be used concurrently with other antibiotics of the macrolide group as the combination may be antagonistic.

DOSES

Dogs:
- Flagyl: 15-25 mg/kg p.o. q12h or 10 mg/kg s.c., slow i.v. infusion q12h. Use higher doses, 25 mg/kg p.o. q12h, for protozoal infections. Injectable solution may be given intrapleurally to treat empyema.
- Stomorgyl: 12.5 mg metronidazole + 23.4 mg spiramycin/kg p.o. q24h for 5-10 days.

Cats:
- 8-10 mg/kg i.v., p.o. q12h. Injectable solution may be given intrapleurally to treat empyema.
- Stomorgyl: 12.5 mg metronidazole + 23.4 mg spiramycin/kg p.o. q24h for 5-10 days.

Small mammals:
- Ferrets: 20 mg/kg p.o. q24h; Rabbits, Guinea pigs, Chinchillas: 10-20 mg/kg p.o. q12h, 40 mg/kg p.o. q24h; 50 mg/kg p.o. q12h for 5 days may be required for giardiasis in chinchillas but use with caution; Rats, Mice: 20 mg/kg s.c. q24h; Other rodents: 20-40 mg/kg p.o. q24h.
- Birds: Raptors: 50 mg/kg p.o. q24h for 5 days; Pigeons: 40-50 mg/kg p.o. q24h for 5-7 days or 100 mg/kg p.o. q48h for 3 doses or 200 mg/kg p.o. once; Parrots: 30 mg/kg p.o. q12h; Passerines: 50 mg/kg p.o. q12h or 200 mg/l water daily for 7 days.
- Reptiles:
  - Anaerobic bacterial infections: Iguanas, Snakes: 20 mg/kg p.o. q24-48h.
  - Protozoal infections: Indigo Snake, Kingsnake: 40 mg/kg p.o., repeat after 14 days; Other snakes, Chelonians: 100-125 mg/kg p.o., repeat after 14 days.
Mexiletine (Mexitil*) POM

Formulations: Oral: 50 mg, 200 mg capsules; 25 mg/ml solution.

Action: Class 1b anti-arrhythmic agent similar to lidocaine. It is an inhibitor of the inward sodium current (fast sodium channel), which reduces the rate of rise of the action potential. In the Purkinje fibres it decreases automaticity, the action potential and the effective refractory period.

Use: Rapid or symptomatic ventricular arrhythmias such as frequent ventricular premature complexes (VPCs) or ventricular tachycardia. It has also proven to be effective in some dogs with supraventricular tachycardia due to the presence of an accessory conduction pathway. Often effective if there has been a response to i.v. lidocaine. Often given orally at the same time as beta blockers, such as atenolol at 0.5-1 mg/kg q12-24h. Has been combined with sotalol in dogs not fully responsive to sotalol alone. Not proven to prevent sudden death in dogs with severe ventricular arrhythmias. Administer oral dose with food to alleviate vomiting.

Safety and handling: Normal precautions should be observed.

Contraindications: Severe congestive heart failure, 2nd or 3rd degree atroventricular block.

Adverse reactions: Nausea, vomiting, depression, convulsions, tremor, nystagmus, bradycardia, hypotension, jaundice and hepatitis.

Drug interactions: The absorption of mexiletine may be delayed by atropine and opioid analgesics. Mexiletine excretion may be reduced by acetazolamide and alkaline urine, and increased by urinary acidifying drugs (e.g. methionine). The action of mexiletine may be antagonized by hypokalaemia. Cimetidine decreases the rate of mexilitene elimination.

DOSES

Dogs: Oral: 6-8 mg/kg p.o. q8-12h. Dose for i.v. not established for dogs.

Cats, Small mammals, Birds, Reptiles: No information available.

Miconazole (Daktarin, Malaseb, Surolan) POM-V

Formulations: Topical: 2% cream/powder (Daktarin); 2% shampoo (Malaseb); 23 mg/ml suspension with prednisolone and polymyxin (Surolan).

Action: Inhibits cytochrome P450-dependent synthesis of ergosterol in fungal cells causing increased cell wall permeability and allowing leakage of cellular contents. Miconazole has activity against Malassezia, Cryptococcus, Candida and Coccidioides.

Use: Fungal skin and ear infections, including dermatophytosis. Miconazole shampoo is useful in the treatment of dermatophytosis in cats but concurrent griseofulvin administration is required.

Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: No information available.
Drug interactions: No information available.

DOSES

Dogs:
- Fungal otitis: 2-12 drops in affected ear q12-24h (Surolan).
- Dermatophytosis: apply a thin layer of cream topically to affected area twice daily. Continue for 2 weeks after a clinical cure and negative fungal cultures.
- *Malassezia* dermatitis: shampoo twice weekly until the clinical signs subside and weekly thereafter or as necessary to keep the condition under control (Malaseb).

Cats:
- Fungal otitis: doses as for dogs.
- Dermatophytosis: Topical: doses as for dogs. *Microsporum canis*: shampoo twice weekly whilst administering griseofulvin for 6-10 weeks or until coat brushings are negative for the culture of *M. canis*, whichever is the longer (Malaseb). The maximum length of the treatment period should not exceed 16 weeks.

Small mammals:
- Rabbits: fungal otitis: 2-12 drops in affected ear q12-24h; dermatophytosis: apply a thin layer of cream topically to affected area twice daily, continue for 2 weeks after a clinical cure and negative fungal cultures.

**Birds, Reptiles:** No information available.

*Midazolam* (Hypnovel*) POM

Formulations: Injectable: 2 mg/ml, 5 mg/ml solutions. Oral: 10 mg/ml solution.

Action: Enhancement of GABA, the main inhibitory neurotransmitter, leads to a sedative effect. Compared with diazepam it is more potent, has a shorter onset and duration of action, and is less irritant to tissues.

Use: Provides sedation with amnesia; as part of a premedication regime, as part of combined anaesthetic protocols, and in the emergency control of epileptic seizures (including status epilepticus). It provides unreliable sedation on its own, although it will sedate depressed animals. It is often used with ketamine to offset the muscle hypertonicity caused by the ketamine. It is used with opioids and/or acepromazine for pre-anaesthetic medication in the critically ill. Midazolam can be diluted with saline, but avoid fluids containing calcium as this may result in precipitation of midazolam.

See Appendix for use in sedative combinations.

Safety and handling: Normal precautions should be observed.
**Contraindications:** Use with caution in cardiac disease, respiratory disease, myasthenia gravis and neonates.

**Adverse reactions:** In humans i.v. administration of midazolam has been associated with respiratory depression and severe hypotension. Excitement may occasionally develop.

**Drug interactions:** Midazolam potentiates the effect of some anaesthetic agents, reducing the dose required, including propofol and some inhalation agents. Concurrent use of midazolam with NSAIDs (in particular diclofenac), antihistamines, barbiturates, opioid analgesics or CNS depressants may enhance the sedative effect. Opioid analgesics may increase the hypnotic and hypotensive effects of midazolam. Erythromycin inhibits the metabolism of midazolam.

**DOSES**

**Dogs, Cats:**
- Emergency management of seizures including status epilepticus: bolus dose of 0.2 to 0.3 mg/kg i.v. or intrarectally if venous access is not available. Time to onset of clinical effect is rapid for i.v. use, therefore repeat q10min if there is no clinical effect up to 3 times. Midazolam may be used in conjunction with diazepam for emergency control of seizures. In dogs additional doses may be administered if appropriate supportive care facilities are available (for support of respiration). Once the seizures have been controlled, the dog can be maintained on a constant i.v. infusion of 0.3 mg/kg/h.
- Sedation: 0.066-0.3 mg/kg i.v., i.m., s.c. or 0.25 mg/kg midazolam and 5-10 mg/kg ketamine and 0.025-0.05 mg/kg acepromazine i.m. or 0.2 mg/kg midazolam and 2 mg/kg ketamine i.v.

**Small mammals:** Ferrets: 0.25-0.5 mg/kg i.v. or 0.2 mg/kg i.m.; Rabbits: 1 mg/kg i.v. or 1-3 mg/kg i.m.; Chinchillas: 1 mg/kg i.v. or 2 mg/kg i.m.; Rodents 2-5 mg/kg i.v., i.m., i.p.

**Birds:** 0.1-0.5 mg/kg i.m. or 0.05-0.15 mg/kg i.v. (premedicant).

**Reptiles:** Premedication: 2 mg/kg i.m.; Chelonia: sedation/anaesthesia: 1-2 mg/kg midazolam + 20-60 mg/kg ketamine i.m.

**Mifepristone** (Mifegyne*) POM

**Formulations:** Oral: 200 mg tablet.

**Action:** Blocks progesterone receptors in the uterus and significantly reduces progesterone levels so that pregnancy cannot be maintained.

**Use:** Termination of pregnancy in bitches.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Nausea and vomiting may be seen.

**Drug interactions:** Avoid concurrent use of NSAIDs until 12 days after mifepristone treatment.
**DOSES**

*Dogs*: 2.5-3.5 mg/kg p.o. q12h for 5 days after day 32 of pregnancy.

*Cats, Small mammals, Birds, Reptiles*: No information available.

---

**Milbemycin** (Milbemax tablets, Program plus) POM-V

**Formulations:** Oral: 2.5 mg/25 mg, 4 mg/10 mg, 16 mg/40 mg, 12.5 mg/125 mg milbemycin/praziquantel tablets (Milbemax); 2.3 mg/46 mg, 5.75 mg/115 mg, 11.5 mg/230 mg, 23 mg/460 mg milbemycin/lufenuron tablets (Program plus).

**Action:** Interacts with GABA and glutamate gated channels, leading to flaccid paralysis of parasites.

**Use:** Treatment of adult nematode infestation; roundworms (*Toxocara canis*, *T. cati*), hookworms (*Ancylostoma caninum*, *A. tubaeforme*) and whipworms (*Trichuris vulpis*). The addition of lufeneron (q.v.) provides flea control. For treatment of flea infestations the additional use of an authorized adulticide is recommended. The addition of prazquantel (q.v.) provides control of cestodes. It is also used for the prevention of heartworm disease (*Dirofilaria immitis*) in countries where this parasite is endemic. Can be used in pregnant and lactating females.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in animals suspected of having heartworm disease. Not for use in dogs <2 weeks old or cats <6 weeks old or in any animal <0.5 kg.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs:**
- With lufenuron: 0.5 mg milbemycin/kg + 10 mg lufeneron/kg p.o. q30d.
- With praziquantel: 0.5 mg/kg milbemycin + 5 mg/kg praziquantel p.o. q30d. For *Angiostrongylus vasorum*: administer same dose 4 times at weekly intervals

**Cats:** 2 mg/kg milbemycin + 5 mg/kg praziquantel p.o. q30d.

**Small mammals, Birds, Reptiles:** No information available.

---

**Milrinone** (Primacor*) POM

**Formulations:** Injectable: 1 mg/ml solution, which may be diluted with saline for i.v. use.

**Action:** Increases cAMP concentrations in myocardium. It acts as a positive inotrope and has mild arteriodilating properties. By bypassing the beta-receptors increased contractility may be maintained chronically.
Use: Used i.v. most commonly in dogs presenting with acute myocardial failure due to DCM. Milrinone is not in common usage.

Safety and handling: Normal precautions should be observed.

Contraindications: Pre-existing arrhythmias.

Adverse reactions: Milrinone may be arrhythmogenic. Monitor blood pressure, heart rate, ECG, CVP, urine output and fluid/electrolyte status. Long-term beneficial effects are not proven. It may cause rupture of chordae tendinae in chronic mitral valve disease.

Drug interactions: Infusions cannot be mixed with furosemide due to chemical incompatibility.

DOSES

Dogs: 1-10 µg/kg/min constant rate infusion.

Cats, Small mammals, Birds, Reptiles: No information available.

Mineral oil see Paraffin

Minocycline (Minocin*, Aknemin*) POM

Formulations: Oral: 50 mg, 100 mg capsules or tablets.

Action: Inhibition of bacterial protein synthesis by binding to the 30S subunit of the bacterial ribosome. The effect is bacteriostatic. Minocycline is the most lipid-soluble tetracycline with a broad spectrum antibacterial activity in addition to antirickettsial, antimycoplasmal and antichlamydial activity. Due to its superior lipid solubility it tends to have greater clinical efficacy compared with other tetracyclines.

Use: Treatment of bacterial, rickettsial, mycoplasmal and chlamydial diseases. Its rate of excretion is not affected by renal function as it is cleared by hepatic metabolism and is therefore recommended when tetracyclines are indicated in animals with renal impairment. Being extremely lipid-soluble, it penetrates well into prostatic fluid and bronchial secretions. Use with care in animals with hepatic disease.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Nausea, vomiting and diarrhoea.

Drug interactions: Absorption of minocycline is reduced by antacids, calcium, magnesium and iron salts and sucralfate. Phenobarbital, phenytoin and primidone may increase its metabolism, decreasing plasma levels.

DOSES

Dogs, Cats: 5-10 mg/kg p.o. q12h.

Small mammals, Birds, Reptiles: No information available.
**Misoprostol** (Cytotec*) POM

**Formulations:** Oral: 200 µg tablet.

**Action:** Cytoprotection of the gastric mucosa: it inhibits gastric acid secretion and increases bicarbonate and mucus secretion, epithelial cell turnover and mucosal blood flow. It prevents, and promotes healing of, gastric and duodenal ulcers, particularly those associated with the use of NSAIDs. Some reports suggest it may not prevent gastric ulceration caused by methylprednisolone. It may also be useful in the management of canine atopy.

**Use:** Protection against NSAID-induced gastric ulceration. In humans doses of up to 20 µg/kg p.o. q6-12h are used to manage pre-existing NSAID-induced gastric ulceration, whilst doses of 2-5 µg/kg p.o. q6-8h are used prophylactically to prevent ulceration. Combinations with diclofenac are available for humans, but are not suitable for small animals because of different NSAID pharmacokinetics.

**Safety and handling:** Women who are or might be pregnant should avoid handling this drug.

**Contraindications:** Do not use in pregnant animals.

**Adverse reactions:** Diarrhoea, abdominal pain, nausea, vomiting and abortion.

**Drug interactions:** Use of misoprostol with gentamicin may exacerbate renal dysfunction.

**DOSES**

- **Dogs:** 2-7.5 µg/kg p.o. q8-12h.
- **Cats:** 5 µg/kg p.o. q8h.
- **Small mammals, Birds, Reptiles:** No information available.

---

**Mitotane** (op’-DDD) (Lysodren*) POM

**Formulations:** Oral: 500 mg tablet or capsule.

**Action:** Necrosis of the adrenal cortex reducing the production of adrenal cortical hormones.

**Use:** Management of pituitary-dependent hyperadrenocorticism (HAC) in dogs. It has been used in the management of adrenal-dependent HAC, but with variable success. Results of treatment in ferrets are largely unsatisfactory and it is rarely indicated. Use of mitotane as first choice therapy for HAC has been largely superseded in the UK by trilostane. However, mitotane is now available in Europe for animals which have failed trilostane therapy. Mitotane should be given with food to improve its absorption from the intestinal tract. Following the initial 7-10 days therapy, an ACTH stimulation test should be performed to monitor the efficacy of therapy. In diabetic animals the initial dose should be reduced by 30%. The addition of prednisolone at a dose of 0.1-0.2 mg/kg p.o. q24h may help decrease the adverse effects associated with acute endogenous steroid withdrawal but is generally not recommended.
Safety and handling: Drug crosses skin and mucous membrane barriers. Wear gloves when handling this drug and avoid inhalation of dust.

Contraindications: No information available.

Adverse reactions: Anorexia, vomiting, diarrhoea and weakness, generally associated with too rapid a drop in plasma cortisol levels. They usually resolve with steroid supplementation. Acute-onset of neurological signs may be seen 2-3 weeks after initiation of therapy, possibly due to rapid growth of a pituitary tumour. Diabetic animals may have rapidly changing insulin requirements during the early stages of therapy. Provide supplemental glucocorticoids during periods of stress. Approximately 5% of dogs require permanent glucocorticoid and mineralocorticoid replacement therapy if given mitotane overdose.

Drug interactions: Barbiturates and corticosteroids increase the hepatic metabolism of mitotane. There may be enhanced CNS depression with concurrent use of CNS depressants. Spironolactone blocks the action of mitotane.

DOSES

Dogs: 30-50 mg/kg p.o. q24h to effect (generally 7-10 days) then weekly to fortnightly as required. Higher doses (50-150 mg/kg p.o. q24h) may become necessary for adrenal carcinomas.

Cats: Similar dose to dogs but efficacy in cats is very variable, with many showing no response at non-toxic levels.

Small mammals: Ferrets: 50 mg/ferret p.o. q24h for 7 days, then 50 mg p.o. q72h until clinical signs resolve.

Birds, Reptiles: No information available.

Mitratapide (Yarvitan) POM-V

Formulations: Oral: 5 mg/ml solution.

Action: Causes a reduced uptake of dietary lipids, dose-dependent decreases in serum cholesterol and triglyceride and an increased presence of triglyceride-containing droplets in enterocytes. Also has a slight appetite decreasing effect.

Use: Aid in the management of overweight and obesity in adult dogs. Should be used as part of an overall weight management programme which also includes appropriate dietary changes. Introducing appropriate lifestyle changes (e.g. increased exercise) may provide additional benefits. In clinical trials, treated animals rapidly regained weight following cessation of treatment when diet was not restricted. Treatment should be given with food. Mitratapide therapy should be restricted to one treatment course for an individual dog.

Safety and handling: Normal precautions should be observed.
**Contraindications:** Do not use in dogs that are pregnant, lactating, <18 months of age or that have impaired liver function. Do not use in dogs in which overweight or obesity is caused by a concomitant systemic disease (e.g. hypothyroidism or hyperadrenocorticism).

**Adverse reactions:** Vomiting, diarrhoea or softened stools may occur during treatment. Reversible decreases in serum albumin, globulin, total protein, calcium and ALP, and increases in ALT, AST and potassium may occur.

**Drug interactions:** No information available.

**DOSES**

*Dogs:* 0.63 mg/kg p.o. q24h (1 ml of the product per 8 kg) given for 2 periods of 21 days with 14 days without treatment in between.

*Cats, Small mammals, Birds, Reptiles:* No information available.

---

**Montmorillonite (Monmorillonite) (Diarsanyl*) GSL**

**Formulations:** Oral: 10 ml, 24 ml, 60 ml multi-dose syringes (paste); 4.5 g montmorillonite, 2.5 g lactose, 2.5 g dextrose, 2.5 g glycerine, 0.4 g citric acid, 35.8 mg/kg sodium, 3.9 mg/kg potassium, 9.2 mg/kg magnesium, 3.9 calcium, 66.4 mg/kg phosphorus per 10 ml of paste.

**Action:** Acts in a similar way to kaolin but has superior adsorbent properties; it can bind mycotoxins and bacteria in vitro. It is combined in Diarsanyl with simple sugars and electrolytes to help compensate for GI electrolyte loss and energy deficiency. The efficacy has been questioned, but montmorillonite has been shown to have some benefit in humans with irritable bowel syndrome.

**Use:** Intestinal protectant and adsorbent in dogs with diarrhoea.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Intestinal obstruction or perforation.

**Adverse reactions:** No information available.

**Drug interactions:** Kaolin may decrease the absorption of lincomycin, trimethoprim and sulphonamides, and a similar effect with montmorillonite is possible.

**DOSES**

*Dogs:* 1 ml p.o. q12h (dogs <7 kg) or 2 ml p.o. q12h (7-17 kg) or 4 ml p.o. q12h (18-30 kg) or 10 ml p.o. q12h (31-60 kg).

*Cats, Small mammals, Birds, Reptiles:* No information available.

---

**Morphine (Morphine*, Oramorph*, Duramorph*) POM CD Schedule 2**

**Formulations:** Injectable: 10 mg/ml, 15 mg/ml, 20 mg/ml, 30 mg/ml solution. Oral: 10 mg, 30 mg, 60 mg, 100 mg tablets. In addition there are suspensions, slow-release capsules, and granules in a wide range of strengths. Rectal: Suppositories are available in a wide range of strengths.
**Action:** Analgesia mediated by the OP3 opioid receptor.

**Use:** Management of moderate to severe pain in the perioperative period. Use as a constant rate infusion to provide analgesia intraoperatively and in the postoperative period. Incorporation into sedative and pre-anaesthetic medication protocols to provide improved sedation and analgesia. Morphine is the reference opioid with which all others are compared. It provides profound analgesia and forms the mainstay of postoperative analgesic protocols in humans. In dogs it has a short duration of action and needs to be given frequently to be effective. Constant rate infusions can also be used to overcome this limitation. The duration of action in cats has not been rigorously evaluated, but it appears to have a duration of action of 3-4 hours. Accumulation is likely to occur after prolonged repeated dosing, which may allow the dose to be reduced or the dose interval extended. Morphine causes histamine release when given rapidly i.v., so it should be diluted and given slowly i.v. It commonly causes vomiting when given to animals preoperatively that are not in pain, therefore morphine should be avoided when vomiting is contraindicated (e.g. animals with raised intraocular pressure). Transient excitation may occur when morphine is given i.v. Oral morphine is rarely used in cats and dogs due to a high first pass metabolism, leading to a low plasma concentration after oral administration.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In common with other OP3 agonists morphine can cause respiratory depression, although this is unlikely when used at clinical doses in awake cats and dogs. Respiratory depression may occur when morphine is given i.v. during general anaesthesia due to the increased depth of anaesthesia that accompanies administration. Respiratory function should be monitored when it is given to anaesthetized patients. Vomiting is common after morphine administration and it causes constriction of GI sphincters (such as the pyloric sphincter) and may cause a reduction in GI motility when given over a long period. The response to all opioids appears to vary between individual patients, therefore assessment of pain after administration is imperative. Morphine is metabolized in the liver, some prolongation of effect may be seen with impaired liver function. Morphine crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Severe adverse effects can be treated with naloxone.

**Drug interactions:** Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillisers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics.

**DOSES**

**Dogs:**
- A dose of 0.5 mg/kg i.v., i.m. q2h is required to produce analgesia in experimental models. Pain should be assessed frequently and the dose adjusted based on requirement for analgesia.
• Continuous rate infusion: 0.15-0.2 mg/kg/h i.v.
• Extradural morphine (use Duramorph as it is preservative-free): 0.1 mg/kg diluted with 0.26 ml/kg of sterile saline (up to a total maximum volume of 6 ml in all dogs). There is a latent period of 30-60 min following extradural administration; duration of action is 18-24 hours.

**Cats:**
• 0.1-0.4 mg/kg i.v., i.m. q3-4h. Pain should be assessed frequently and the dose adjusted based on requirement for analgesia.
• Continuous rate infusions of morphine have not been widely evaluated in cats.
• Extradural morphine: dose as for dogs.

**Small mammals:** Ferrets: 0.5-5 mg/kg i.m., s.c. q6h, 0.1 mg/kg epidural; Rabbits, Guinea pigs: 2-5 mg/kg i.m., s.c. q2-4h; Hamsters, Gerbils, Rats, Mice: 2.5 mg/kg i.m., s.c. q2-4h.

**Birds, Reptiles:** No information available.

---

**Moxidectin** (Advocate) POM-V

**Formulations:** Topical for cat: 10 mg/ml moxidectin + 100 mg/ml imidacloprid in spot-on pipette. Topical for dog: 25 mg/ml moxidectin + 100 mg/ml imidacloprid in spot-on pipette.

**Action:** Interacts with GABA and glutamate gated channels, leading to flaccid paralysis of parasites.

**Use:** Treatment and prevention of flea infestation (*Ctenocephalides felis*), ear mite infestation (*Otodectes cyanotis*) and heartworm disease (*Dirofilaria immitis*). In dogs it is used for the treatment of sarcoptic mange, GI nematodes (L4 larvae and adult *Toxocara canis*, *Ancylostoma caninum*, *Uncinaria stenocephala*, adult *Toxascaris leonina* and *Trichurus vulpis*). For effective treatment of canine sarcoptic mange the product should be applied on 3 occasions at 2 week intervals. Although approved for the treatment of canine demodicosis this product is not uniformly efficacious. Frequent shampooing may reduce the efficacy of the product. In cats it is used for the treatment of GI nematodes (L4 and adult *Toxocara cati* and *Ancylostoma tubaeforme*). The minimum dose recommendation for cats and dogs is 0.1 ml/kg.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Not for use in cats <9 weeks old, dogs <7 weeks old.

Severe effects may be seen if applied to cats with adult heartworm disease. Highly toxic to aquatic organisms.

**Adverse reactions:** Transient pruritus and erythema and the site of application may occur.

**Drug interactions:** No information available.
DOSES

Dogs: 0.4 ml, 1.0 ml, 2.5 ml, 4 ml pipettes according to size of dog. Apply once every month.

Cats: 0.4 ml, 0.8 ml pipettes according to size of cat. Apply once every month.

Birds: 0.2 mg/kg topically prn.

Small mammals, Reptiles: No information available.

Mupirocin (Pseudomonic acid A) (Bactroban*) POM

Formulations: Topical: 2% cream, ointment.

Action: Mupirocin has a novel chemical structure unrelated to any other known class of antibiotic. It blocks protein synthesis in bacteria by inhibiting bacterial isoleucyl-tRNA synthetase.

Use: Management of bacterial skin infections; especially those associated with Staphylococcus spp. As a consequence of this unique mode of action, mupirocin lacks cross-resistance with other antibacterial agents and exhibits activity against multiresistant strains of bacteria. Uses for mupirocin include canine pyotraumatic (acute moist) dermatitis, intertrigo (fold pyoderma), callus pyoderma and canine and feline acne. Mupirocin inhibits growth of several pathogenic fungi, including a range of dermatophytes and Pityrosporum spp. and topical application may be useful in controlling such infections, although data are currently lacking as to its efficacy in vivo. Routine use of this agent cannot be advocated since in human medicine this agent is reserved for the eradication of MRSA within the nasal cavity and low-level resistance to mupirocin is emerging. It is generally indicated for the management of resistant infections. Use only if there are no alternative treatment options and do not use for longer than 7 days to avoid the development of resistance.

Safety and handling: Use impervious gloves for application.

Contraindications: Avoid if renal impairment present.

Adverse reactions: Application in humans has been associated with a stinging sensation.

Drug interactions: No information available.

DOSES

Dogs, Cats: Apply a thin layer of cream to infected areas q8h.

Small mammals, Birds, Reptiles: No information available.

Mycophenolic acid (Mycophenolate, Mofetil (MMF)) (CellCept* (MMF), Myfortic* (MPA)) POM

Formulations:
Oral: 250 mg capsule, 500 mg tablet, 1 g/5 ml powder for oral suspension (Mycophenolate mofetil); 180 mg, 360 mg tablets.
Injectable: 500 mg powder for reconstitution and slow i.v. infusion (Mycophenolic acid).

**Action:** Inhibits the enzyme that controls the rate of synthesis of guanine monophosphate in the *de novo* pathway of purine synthesis. This pathway is important in the proliferation of B and T lymphocytes. This action is similar to azathioprine.

**Use:** Prevention of organ transplant rejection in humans but it is beginning to be used in a number of immune-mediated conditions. In veterinary medicine MMF use has been reported in a small number of cases of immune-mediated skin disease, myasthenia gravis, immune-mediated haemolytic anaemia and immune-mediated thrombocytopenia. The use of MPA has not been reported in the veterinary medicine. Clinical veterinary experience of this drug is limited; however, in humans mycophenolate is more lymphocyte-specific and less bone marrow suppressive than azathioprine.

**Safety and handling:** Disposable gloves should be worn to handle/administer tablets. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with care.

**Contraindications:** Bone marrow suppression, pre-existing infections.

**Adverse reactions:** Bone marrow suppression, nausea, vomiting, diarrhoea and an increased incidence of infections (pyoderma, Malassezia).

**Drug interactions:** Competes with other drugs that undergo active renal tubular secretion resulting in increased concentration of either drug. Concomitant administration of antacids may decrease absorption.

**DOSES**

**Dogs:**
- Immune-mediated haemolytic anaemia: 10-15 mg/kg p.o. q12-24h (MMF).
- Pemphigus: 7-13 mg/kg p.o. q8h (MMF).

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Nalbuphine** (Nubain®) POM

**Formulations:** Injectable: 10 mg/ml, 20 mg/ml solutions.

**Action:** Provision of analgesia through an agonist effect at OP2 receptors.

**Use:** Management of mild postoperative pain. Antagonism of adverse effects of pre-administered opioid agonists, without complete reversal of analgesia. In rabbits it may be used to reverse the sedative effects of fentanyl/fluanisone (Hypnorm). Analgesia provided by OP2 receptor agonists is usually inferior to analgesia provided by OP3 receptor agonists (e.g. morphine); therefore nalbuphine is not suitable for the management of moderate to severe pain. It has a reasonably
fast onset of action (15 min after i.m. administration, 2-3 min i.v.) and moderate duration of action (3-6 h in humans). Analgesia by nalbuphine has not been widely evaluated in cats and dogs. It causes marked sedation and has been used in premedication and sedation protocols. If analgesia following nalbuphine is inadequate, analgesia can be supplemented by OP3 agonists or other classes of analgesic drugs. In rabbits it may be used to reverse the sedative effects of fentanyl/fluanisone combinations.

Safety and handling: Normal precautions should be observed.

Contraindications: Avoid in cases with severe pain or where severe pain is anticipated. Full OP3 agonist opioids are preferred in such cases.

Adverse reactions: Respiratory depression is unlikely following clinical doses but may occur if given during anaesthesia or to sedated animals. Severe effects can be treated with naloxone. Opioid-related side effects (e.g. vomiting, dysphoria, respiratory depression, bradycardia) are less likely with nalbuphine compared to morphine.

Drug interactions: In common with other opioids, nalbuphine will reduce the doses of other drugs required for induction and maintenance of anaesthesia. Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillizers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics. Administration of nalbuphine will reduce analgesia produced from full OP3 agonists (therefore avoid including nalbuphine in premedication when administration of potent opioids during surgery is anticipated).

DOSES

Dogs, Cats: 0.1-0.2 mg/kg i.v., s.c., i.m.

Small mammals: Rabbits: 1-2 mg/kg i.v., i.m. q4-5h; Guinea pigs: 1-2 mg/kg i.m., s.c. q3-8h; Gerbils, Hamsters, Rats, Mice: 4-8 mg/kg i.m., s.c. q3h.

Birds, Reptiles: No information available.

**Naloxone** (Naloxone*, Narcan*) POM

Formulations: Injectable: 0.02 mg/ml, 0.4 mg/ml solutions.

Action: Competitive antagonist for opioid receptors, reversing the effects of opioid agonists.

Use: Treatment of opioid overdose to reverse the adverse effects of opioid agonists. Also used to identify persistent activity of opioid drugs. Onset of action i.v. is very rapid, but duration is short (30-40 min). Repeated doses or an infusion may be required to manage overdose of longer acting opioids such as morphine and methadone or high dose fentanyl. Naloxone will also antagonize the effects of endogenous opioids, therefore it can cause antianalgesic effects in opioid naïve subjects. Administration to animals that could be in pain must therefore be considered carefully. Low dose naloxone i.v. will
cause a transient elevation of unconsciousness when persistent opioid activity contributes to an unexpectedly long recovery from anaesthesia.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Indiscriminate use in animals that have undergone major surgery or trauma will expose the recipient to acute severe discomfort. In such cases the effects of opioid overdose i.e. respiratory depression should be managed by endotracheal intubation and artificial ventilation. Naloxone should be reserved for emergency situations when the effects of opioid overdose are severe.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 0.015-0.04 mg/kg i.v., i.m., s.c., intratracheal.

**Small mammals:** Ferrets: 0.01-0.04 mg/kg i.v., i.m., s.c.; Rodents: 0.01-0.1 mg/kg s.c. i.v., i.p.

**Birds, Reptiles:** No information available.

---

**Nandrolone** (Laurabolin, Nandrolin, Retarbolin) POM-V

**Formulations:** Injectable: 10 mg/ml, 25 mg/ml, 50 mg/ml (in oil).

**Action:** Binds to testosterone receptors and stimulates protein synthesis.

**Use:** For use wherever excessive tissue breakdown or extensive repair processes are taking place. Has also been advocated in the management of aplastic anaemia and anaemia associated with renal failure. Monitor haematology to determine the efficacy of treatment and liver enzymes to monitor for hepatotoxicity.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in breeding bitches or queens, in pregnant animals or in those with liver disease or diabetes mellitus.

**Adverse reactions:** Androgenic effects may develop. Use in immature animals may result in early closure of epiphyseal growth plates.

**Drug interactions:** The concurrent use of anabolic steroids with adrenal steroids may potentiate the development of oedema.

**DOSES**

**Dogs:** 1-5 mg/kg i.m., s.c. q21 days. Maximum dose 40-50 mg.

**Cats:** 1-5 mg/kg i.m., s.c. q21 days. Maximum dose 20-25 mg.

**Small mammals, Birds:** No information available.

**Reptiles:** 1 mg/kg i.m. q7-14d.
**Natamycin** *(Pimaricin) (Mycophyt)* POM-VPS

**Formulations:** Topical: powder for preparation of suspension containing 0.01% w/v natamycin.

**Action:** Binds to ergosterol, a major component of the fungal cell membrane, and forms pores in the membrane that lead to potassium leakage and death of the fungus.

**Use:** Used topically to control fungal infections of the skin and external ear canal caused by *Trichophyton, Microsporum, Malassezia, Aspergillus, Pityrosporum canis* and *Candida*.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use with other topical preparations.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Make up according to the manufacturer’s recommendations and apply to the affected area or whole body by sponging.

**Small mammals, Birds, Reptiles:** No information available.

**Neomycin** *(Auroto, Kaobiotic, Maxitrol, Neopen, Nivemycin, Oterna, Panolog) POM-V, POM

**Formulations:** Oral: 5.96 mg (Kaobiotic), 500 mg tablets (Nivemycin). Kaobiotic also contains sulfadiazine, sulphaguanidine, sulphamerazine, sulphathiazole, kaolin and pectin. Parenteral: 100 mg/ml neomycin combined with 200 mg/ml penicillin G (Neopen). Topical: Many dermatological, ophthalmic and otic preparations contain 0.25-0.5% neomycin.

**Action:** A bactericidal antimicrobial agent that inhibits bacterial protein synthesis once it has gained access to the bacterial cell via an oxygen-dependent carrier mechanism. As other aminoglycosides, neomycin operates a concentration-dependent cell killing mechanism, leading to a marked post-antibiotic effect.

**Use:** Active primarily against Gram-negative bacteria, although some *Staphylococcus* and *Enterococcus* species are sensitive. All obligate anaerobic bacteria and many haemolytic streptococci are resistant. Since parenteral neomycin is extremely nephrotoxic and ototoxic it is used topically for infections of the skin, ear or mucous membranes. It is also used orally to reduce intestinal bacterial population in the management of hepatic encephalopathy. As with other aminoglycosides it is not absorbed after oral administration unless GI ulceration is present. This drug has been used (often combined with antimuscarinic agents) in the treatment of non-specific bacterial enteritides. However, other antibacterial drugs, if required at all, are better indicated for such use. Neomycin is more active in an alkaline environment.

**Safety and handling:** Normal precautions should be observed.
Contraindications: For systemic use, do not use in animals with pre-existing renal disease. Do not use ear preparations if the ear drum is ruptured.

Adverse reactions: Systemic toxicity, ototoxicity and nephrotoxicity may very occasionally occur following prolonged high-dose oral therapy or where there is severe GI ulceration/inflammatory bowel disease, as sufficient neomycin may be absorbed. Nephrotoxicity and ototoxicity are potential side effects associated with parenteral use. Some patients may develop a severe diarrhoea/malabsorption syndrome and bacterial or fungal superinfections.

Drug interactions: Absorption of digoxin, methotrexate, potassium and vitamin K may be decreased. Other ototoxic and nephrotoxic drugs, e.g. furosemide, should be used with caution in patients on oral neomycin therapy as the combinations are likely to be synergistic.

DOSES

**Dogs:** Oral: 20 mg/kg p.o. q6h; or per rectum as a retention enema for hepatic encephalopathy. Ophthalmic: 1 drop/eye q6-8h. Otic: 2-12 drops/ear or apply liberally to skin q4-12h.

**Cats:** Oral: 5.5-10 mg/kg p.o. q12h. Ophthalmic: 1 drop/eye q6-8h. Otic: 2-12 drops/ear or apply liberally to skin q4-12h.

**Small mammals:** Ferrets: 10-20 mg/kg p.o. q6h; Rabbits 30 mg/kg p.o. q12h; Chinchillas, Guinea pigs: 15 mg/kg q12h p.o.; Rats, Mice: 25 mg/kg q12h p.o.; In-water medication: Hamsters: 0.5 mg/ml drinking water; Gerbils, Rats, Mice: 2.6 mg/ml drinking water. Ophthalmic and otic doses as for dogs and cats.

**Birds, Reptiles:** No information available.

**Neostigmine** *(Prostigmin*, Robinul-Neostigmine*) POM

**Formulations:** Injectable: 2.5 mg/ml solution. Oral: 15 mg tablets.

**Action:** Prolongs the action of acetylcholine. In comparison with edrophonium, it has a slower onset but a longer duration of action.

**Use:** Treatment of acute myasthenic crises when oral dosing is not possible. Due to its longer duration of effect it is also used in the diagnosis of myasthenia gravis when the collapse episodes are brief. In these cases the effect of neostigmine treatment on the abolition of the collapse episodes is assessed, rather than the injection of an anticholinesterase drug after the collapse episode. Neostigmine is also used to antagonize non-depolarizing neuromuscular blocking agents. If neostigmine is being used to diagnose myasthenia gravis then atropine should be given at an effective dose and demonstrated to have had an effect (dry buccal mucous membranes) prior to administration. If an overdose of neostigmine has been administered, maintenance of respiration should take priority. Atropine does not antagonize the nicotinic effects, including muscle weakness and paralysis. If muscle twitching is severe, these can be controlled with small doses of a competitive neuromuscular blocker. The cholinesterase reactivator pralidoxime can be used as an adjunct to atropine. Supportive treatment should be provided as required.
Safety and handling: Normal precautions should be observed. Contraindications: Contraindicated in mechanical GI or urinary tract obstruction and in peritonitis. Use with extreme caution in cardiac disease (in particular arrhythmias and bradycardia) and respiratory disease (especially feline asthma). Adverse reactions: Primarily due to excessive cholinergic stimulation and most commonly include nausea, vomiting, increased salivation and diarrhoea. Overdosage may lead to muscle fasciculations and paralysis. Severe bradyarrhythmias, even asystole, may occur if neostigmine is used to antagonize neuromuscular block without the co-injection of atropine. Overdosage may lead to a ‘cholinergic crisis’, with both muscarinic and nicotinic effects. These effects may include lacrimation, defecation and urination, miosis, nystagmus, bradycardia and other arrhythmias, hypotension, muscle cramps, fasciculations, weakness and paralysis, respiratory signs and increased bronchial secretion combined with bronchoconstriction. CNS side effects include ataxia, seiuzures and coma. Drug interactions: Effect may be antagonized by drugs with neuromuscular blocking activity, including aminoglycosides, clindamycin and halogenated inhalational anaesthetics. Drugs that may increase the clinical severity of myasthenia gravis may reduce the effectiveness of neostigmine treatment in these cases, including quinine and related compounds, procainamide and beta blockers. Concurrent use of neostigmine and beta blockers may result in bradycardia. Neostigmine, as well as other anticholinesterases, inhibits the metabolism of suxamethonium, thereby prolonging and enhancing its clinical effect; combined use is not recommended. Neostigmine antagonizes the effect of non-depolarizing muscle relaxants. Antimuscarinic drugs such as atropine antagonize the muscarinic effects of neostigmine.

DOSES

Dogs:
• Myasthenic crisis: 0.01-0.1 mg/kg i.v., i.m., s.c., interval dependent upon duration of response. For longer term use 0.1-0.25 mg/kg p.o. q4h (total daily dose not to exceed 2 mg/kg).
• Antagonism of non-depolarizing neuromuscular blocking agents: Neostigmine (0.05 mg/kg) is mixed with glycopyrronium (0.01 mg/kg) and injected i.v. over 2 min once signs of spontaneous recovery from ‘block’, e.g. diaphragmatic ‘twitching’, are present. Continued ventilatory support should be provided until full respiratory muscles activity is restored. If glycopyrronium is unavailable, atropine (0.04 mg/kg) is given i.v., followed by neostigmine (0.05 mg/kg) as soon as heart rate rises.

Cats:
• Myasthenic crisis: Use not reported in cats but extrapolation from dogs seems reasonable.
• Antagonism of non-depolarizing neuromuscular blocking agents: Doses as for dogs.

Small mammals, Birds, Reptiles: No information available.
Niacinamide see Nicotinamide

Nicergoline (Fitergol) POM-V
Formulations: Oral: 5 mg freeze-dried tablets.
Action: Blocks serotonin and dopamine receptors and is an alpha-adrenergic antagonist, primarily acting through alpha-1 adrenoceptors. Its reported effects are to promote cerebral vasodilation, thereby improving cerebral oxygenation, and to have a neuroprotective action.
Use: Used to improve ageing-related disorders in dogs, particularly those of behavioural origin: e.g. diminished vigour and vigilance fatigue, sleep disorders, and psychomotor disturbances (such as episodes of ataxia). However, clinically apparent benefits of its pharmacological effects have not been published. Specific age-related diseases should receive appropriate treatment.
Demonstrates a wide safety margin: administration of up to 90 times the normal recommended dose in dogs for 6 months has produced no adverse effects.
Safety and handling: The freeze-dried tablets should not be broken in half. For dogs 5-10 kg the drug may be administered in solution. Owners should be instructed to dissolve one tablet in 10 ml of water, stir or shake gently until dissolved, and then immediately administer 5 ml of the solution. The remainder of the solution must be discarded. A 10 ml syringe and suitable container should be provided for this purpose. Owners should be clearly instructed not to use household utensils for preparing the solution.
Contraindications: No information available.
Adverse reactions: No information available.
Drug interactions: Do not use within 24 hours of alpha-2 agonists such as xylazine, medetomidine and romifidine. Do not use before treatment with vasodilators such as acepromazine and prazosin.
DOSES
Dogs: 0.25-0.50 mg/kg q24h p.o. for 30 days. Treatment may be repeated depending on outcome.
Cats, Small mammals, Birds, Reptiles: No information available.

Nicotinamide (Niacinamide, Vitamin B3) (numerous trade names) GSL
Formulations: Oral: 50 mg, 250 mg tablets.
Action: Specific action unknown.
Use: Has been used in combination with oxytetracycline/tetracycline or doxycycline in the management of certain immune-mediated dermatoses such as lupoid onychodystrophy, discoid lupus erythematosus and pemphigus foliaceus. Do not use nicotinic acid (niacin) as it causes vasodilation.
Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: May cause mild GI irritation.

Drug interactions: No information available.

DOSES

**Dogs:** 250 mg q8h (dogs up to 25 kg), 500 mg q8h (>25 kg). Taper to effect.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Nimesulide** (Zolan) POM-V

**Formulations:** Oral: 50 mg, 100 mg tablets.

**Action:** Nimesulide is an NSAID that preferentially inhibits COX-2 enzyme, thereby limiting the production of prostaglandins involved in inflammation.

**Use:** To reduce inflammation and pain associated with musculoskeletal disorders in dogs. It may also produce a range of other anti-inflammatory effects, including inhibition of the neutrophil oxidative response, inhibition of the synthesis of platelet activating factor, and a reduction in the synthesis of cartilage degrading enzymes. Nimesulide is not authorized for preoperative administration to cats and dogs.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Do not administer perioperatively until animal is fully recovered from anaesthesia and normotensive. Do not give to pregnant animals, animals <4 months or <3.5 kg. Liver disease will prolong metabolism, leading to the potential for drug accumulation and overdose with repeated dosing. Administration to animals with renal disease must be carefully evaluated. Do not give to cats.

Adverse reactions: GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease. A dark yellow discoloration of the serum or urine may be observed.

Drug interactions: Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES

**Dogs:** 5 mg/kg q24h for 3-5 consecutive days, given with food.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.
Nitenpyram (Capstar) AVM-GSL

Formulations: Oral: 11.4 mg, 57 mg tablets.

Action: Post-synaptic binding to insect nicotinic receptors leads to insect paralysis and death.

Use: Fleas on dogs and cats. Should be used as part of a fully integrated flea control programme. All animals in the affected household should be treated.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Transient increase in pruritus may be seen after administration due to fleas reacting to the product.

Drug interactions: No information available.

DOSES

Dogs, Cats: 1 mg/kg once or q24h.

Small mammals, Birds, Reptiles: No information available.

Nitrofurantoin (Nitrofurantoin*, Furadantin*) POM

Formulations: Oral: 50 mg, 100 mg tablets; 25 mg/5 ml suspension.

Action: Reacts with bacterial nitroreductase enzymes to form products that interact with bacterial DNA and cause strand breakage. It is bacteriostatic at low concentrations and bactericidal at high concentrations.

Use: Active against many Gram-positive and Gram-negative bacteria. Well absorbed following oral administration but is rapidly excreted in urine, thus therapeutic levels are not attained in serum or most tissues but are attained in the urinary tract. The concentration of nitrofurantoin is highest in alkaline urine. However, urine should not be alkalinized as the activity of nitrofurantoin is significantly decreased. Use is limited due to toxicity and concerns about mutagenicity and carcinogenicity. Reserve for infections with confirmed sensitivity.

Safety and handling: Mutagenic so wear gloves when handling.

Contraindications: Do not use in patients with significant renal impairment, as serum levels will rise and give an increased risk of serious toxicity. Since nitrofurans are mutagenic, they should not be given to pregnant animals.

Adverse reactions: In humans may rarely cause a peripheral neuritis, pulmonary complications, hepatotoxicity, emesis, diarrhoea and GI bleeding. High oral doses may cause thrombocytopenia, anaemia and leucopenia, with prolonged bleeding times.

Drug interactions: The bioavailability of nitrofurantoin may be increased by antimuscarinic drugs and food as they delay gastric emptying time and increase absorption of this weak acid from the stomach. Antagonism may be observed with fluoroquinolones.
DOSES

*Dogs, Cats*: 4 mg/kg p.o. q8h.

*Small mammals, Birds, Reptiles*: No information available.

**Nitroglycerin(e)** see **Glyceryl trinitrate**

**Nitroprusside** (Sodium nitroprusside*) POM

**Formulations**: Injectable: 50 mg ampoule for reconstitution, giving a 10 mg/ml solution.

**Action**: A very potent vasodilator that acts independently of the autonomic innervation and is rapidly metabolized to cyanide and nitric oxide. Markedly lowers systemic and pulmonary vascular resistance and systemic arterial blood pressure, thereby increasing cardiac output and reducing ventricular filling pressure.

**Use**: Indicated for the short-term management of severe systemic hypertensive crises, acute life-threatening heart failure secondary to mitral or aortic regurgitation, and severe refractory CHF. Often used in combination with dopamine or dobutamine. To prepare solution for injection: Add 2-3 ml 5% dextrose to vial. Add dissolved solution to 1 litre of 5% dextrose and promptly protect solution from light (aluminium foil or other opaque covering). The administration set need not be protected from light. The resultant solution containing 50 µg/ml of nitroprusside, is stable for 24 hours after reconstitution and will have a brownish tint. Discard if it turns blue, dark red or green. Do not add other drugs to nitroprusside solutions. Monitor blood pressure continuously and avoid extravasation at the i.v. site. Do not administer for longer than 24 hours to reduce the problem of thiocyanate toxicity.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Hypotension. Care in dogs with hepatic or renal impairment.

**Adverse reactions**: Nausea, tremors, retching, dizziness. Once the infusion ceases, blood pressure will return to pretreatment levels within 1-10 min. Excessive doses, prolonged therapy, depletion of hepatic thiosulphate supply, or severe hepatic or renal insufficiency may lead to profound hypotension, cyanide or thiocyanate toxicity. Withdraw the drug gradually following prolonged use, as sudden withdrawal may cause a rebound increase in systemic vascular resistance and ventricular filling pressures. Initiate oral vasodilator therapy prior to discontinuation. Monitor acid/base status to evaluate therapy and to detect metabolic acidosis (early sign of cyanide toxicity). Administer vitamin B12 parenterally as this may prevent cyanide toxicity. Thiocyanate toxicity may cause delirium; monitor serum thiocyanate levels in patients on prolonged therapy if possible, especially those with concurrent renal dysfunction; plasma thiocyanate concentrations >10 mg/dl are toxic.
Drug interactions: The hypotensive effects of nitroprusside may be enhanced by anaesthetics, beta-blockers (e.g. propranolol), calcium-channel blockers (e.g. diltiazem), corticosteroids, diuretics and NSAIDs. Sympathomimetics may cause an additive tachycardia.

DOSES

Dogs, Cats: 1-15 µg/kg/min i.v. constant infusion using flow control device to provide accurate dose. Start at lower rates (1 µg/kg/min) and titrate up according to effect. Usually this involves increasing by 0.5-1 µg/kg/min every 5 min until the desired effect is achieved. A dose of 3 µg/kg/min controls most patients.

Small mammals, Birds, Reptiles: No information available.

Nitroscanate (Lopatol, Troscan) AVM-GSL

Formulations: Oral: 100 mg, 500 mg tablets.

Action: Unclear but appears to be an uncoupler of oxidative phosphorylation.

Use: Highly effective in a single dose against common canine nematodes and cestodes including Toxocara canis, Toxascaris leonina, Ancylostoma caninum, Uncinaria stenocephala, Taenia ovis, T. hydatigena, T. pisiformis and Dipylidium caninum. At the recommended dose gives limited control of Echinococcus granulosus. Not effective against Trichuris vulpis.

Safety and handling: Nitroscanate is irritant and tablets should not be crushed, broken or divided.

Contraindications: Do not administer to sick or convalescing animals. Do not use in cats.

Adverse reactions: Vomiting in dogs. If given mistakenly to cats CNS disturbances (ataxia and disorientation) are seen.

Drug interactions: No information available.

DOSES

Dogs: 50 mg/kg p.o. with one-fifth of the daily food ration in the morning. Tablets should be given whole. Give remaining food ration after 8 hours.

Cats: Do not use.

Small mammals, Birds, Reptiles: No information available.

Nitrous oxide (Nitrous oxide*, Entonox*) POM

Formulations: Inhalational: 100% nitrous oxide (N₂O) gas. Entonox is N₂O plus oxygen.

Action: Causes CNS depression.

Use: Used with oxygen to carry volatile anaesthetic agents such as isoflurane for the induction and maintenance of anaesthesia. N₂O
reduces the concentration of inhalant agent required to maintain anaesthesia. Administration of $N_2O$ at the beginning of volatile agent anaesthesia increases the speed of uptake of volatile agent from the alveoli (via the 2nd gas effect and concentration effect), hastening attainment of a stable plane of volatile agent anaesthesia. Oxygen must be supplemented for 5-10 min after $N_2O$ is discontinued to prevent diffusion hypoxia. $N_2O$ causes minimal respiratory and cardiovascular effects and is a useful addition to a balanced anaesthesia technique. A minimum oxygen concentration of 30% is required during anaesthesia. The inspired concentration of oxygen may fall to critically low levels when $N_2O$ is used in rebreathing circuits during low flow rates. Do not use in such systems unless the inspired oxygen concentration can be measured on a breath by breath basis.

**Safety and handling:** Prolonged exposure can have serious adverse effects on human health. Scavenging is essential.

**Contraindications:** Do not give to patients with air-filled spaces within the body, e.g. pneumothorax or gastric dilatation. NO will cause a rapid expansion of any gas-filled space, increasing volume or pressure.

**Adverse reactions:** The cobalt ion present in vitamin B12 is oxidized by $N_2O$ so that it is no longer able to act as the cofactor for methionine synthase. The result is reduced synthesis of methionine, thymidine, tetrahydrofolate and DNA. Exposure lasting only a few hours may lead to megaloblastic changes in bone marrow but more prolonged exposure (a few days) may result in agranulocytosis.

**Drug interactions:** No information available.

**DOSES**

* Dogs, Cats, Small mammals, Birds: Inspired concentrations of 50-70%.

* Reptiles: No information available.

**Nizatidine** (Axid*, Nizatidine*) POM

**Formulations:** Injectable: 25 mg/ml solution. Oral: 150 mg, 300 mg capsules, tablets.

**Action:** Nizatidine is a potent histamine (H2) receptor antagonist blocking histamine-induced gastric acid secretion. It is many times more potent than cimetidine, and does not undergo hepatic metabolism. It also has some prokinetic effect through stimulation of local muscarinic acetylcholine receptors, which may be of benefit when gastric motility is impaired by gastritis or ulceration, and in feline idiopathic megacolon.

**Use:** Management of gastric and duodenal ulcers, idiopathic, uraemic or drug-related erosive gastritis, oesophagitis, and hypersecretory conditions secondary to gastrinoma, mast cell neoplasia or short bowel syndrome. Reduction of vomiting due to gastric ulceration is
typically achieved in about 2 weeks. Animals should, however, be treated for at least 2 weeks after the remission of clinical signs, so a minimum treatment duration of 28 days is recommended. Absorption is not clinically significantly affected by food intake, anticholinergic agents, or antacids. Currently cimetidine is the only anti-ulcer drug with a veterinary market authorization. However, in situations where a GI prokinetic effect is desired, use of nizatidine may be justified under the cascade.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** There is little information on the use of this drug in veterinary medicine. Safety in healthy dogs has been established, and no adverse effects have been reported. However, if used i.v., slow injection is recommended.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 1 mg/kg i.v. q12h; 2.5 mg/kg p.o. q12-24h.

**Small mammals, Birds, Reptiles:** No information available.

---

**Normal saline** see **Sodium chloride**

---

**Nystatin** (Canaural, Nystatin*, Nystan*, Panolog) POM-V

**Formulations:** Oral: 100,000 IU/ml suspension. Topical: various products.

**Action:** Binds to ergosterol, a major component of the fungal cell membrane, and forms pores in the membrane that lead to potassium leakage and death of the fungus.

**Use:** Antifungal agent with a broad spectrum of activity but noted for its activity against *Candida*, particularly *C. albicans*. Not absorbed from the GI tract.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** Apply to affected areas q8-12h.

**Small mammals:** No information available.

**Birds:** Pigeons: 100,000 IU/kg p.o. q24h for 10 days; Passerines: 5,000-300,000 IU/kg q12h for macrorhabdiasis, though there are many doubts over its efficacy; Other birds: 300,000 IU/kg p.o. q12h.

**Reptiles:** 100,000 IU/kg p.o. q24h for 10 days.
Octreotide (Sandostatin*, Sandostatin LAR*) POM

**Formulations:** Injectable: 50 µg/ml, 100 µg/ml, 200 µg/ml, 500 µg/ml solutions; depot preparation: 10 mg, 20 mg, 30 mg vials.

**Action:** Somatostatin analogue that inhibits the release of several hormones.

**Use:** May be useful in the management of gastric, enteric and pancreatic endocrine tumours (e.g. insulinoma, gastrinoma) and acromegaly. Variable responses have been reported in veterinary medicine. Tumours not expressing somatostatin receptors will not respond. There is limited information on the use of this drug in veterinary species. In humans doses up to 200 µg/person q8h are used. Similar doses of the aqueous preparation may be required in animals, but dosages for the depot preparation are not known.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** GI disturbances (anorexia, vomiting, abdominal pain, bloating, diarrhoea and steatorrhoea), hepatopathy and pain at injection sites have been recorded in humans.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 10-20 µg/animal s.c. q8-12h.

**Small mammals, Birds, Reptiles:** No information available.

Oestradiol see Estradiol

Oestriol see Estriol

Ofloxacin (Exocin*) POM

**Formulations:** Topical: 0.3% solution.

**Action:** Bactericidal antimicrobial which works by inhibiting the bacterial DNA gyrase enzyme, causing damage to the bacterial DNA. The fluoroquinolones work in a concentration-dependent manner.

**Use:** For ophthalmic use when other antibacterial agents are ineffective. Active against many ocular pathogens, including *Staphylococcus* spp. and *Pseudomonas aeruginosa*, although there is increasing resistance amongst some staphylococcal and streptococcal organisms. Use should be reserved for serious corneal infections due to sensitive organisms, particularly aminoglycoside-resistant *Pseudomonas* and should ideally be dictated by sensitivity results.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** May cause local irritation after application

**Drug interactions:** No information available.
DOSES

**Dogs, Cats:** 1 drop to affected eye q6h; loading dose can be used 1 drop to affected eye q15min for 4 doses.

**Small mammals:** No information available.

**Birds:** 1 drop in affected eye q12h.

**Reptiles:** 1 drop in affected eye q8-12h.

---

**Olsalazine** (Dipentum*) POM

**Formulations:** Oral: 250 mg capsule, 500 mg tablet.

**Action:** Olsalazine is a dimer of 5-aminosalicylic acid (5-ASA) that is cleaved by colonic bacteria into free 5-ASA, which has a local anti-inflammatory effect.

**Use:** Management of colitis, especially in patients sensitive to sulfasalazine. Although the incidence of keratoconjunctivitis sicca is much lower than with sulfasalazine, it is still a potential risk, and periodic Schirmer tear tests should be performed.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in patients sensitive to salicylates.

**Drug interactions:** Activity will be potentiated by administration of other NSAIDs.

**DOSES**

**Dogs:** 10-20 mg/kg p.o. q12h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Omeprazole** (Gastrogard, Losec, Mepradec, Zanprol) POM-V, POM

**Formulations:** Oral: 10 mg, 20 mg, 40 mg capsules, gastro-resistant tablets, MUPS (multiple unit pellet system) tablets. Injectable: 40 mg vial for reconstitution for i.v. injection; discard remainder after use.

**Action:** Proton pump inhibitor. Ten times more potent than cimetidine in inhibiting gastric acid secretion and has a longer duration of activity (>24 h).

**Use:** Management of gastric and duodenal ulcers, idiopathic, uraemic or drug-related erosive gastritis, oesophagitis, and hypersecretory conditions secondary to gastrinoma (Zollinger-Ellison syndrome) or mast cell neoplasia. Gastrogard is licensed for use in equids, but the formulation (370 mg/g paste) makes accurate dosing of small animals impossible. Lansoprazole (Zoton), rabeprazole (Pariet) and pantoprazole (Protium) are similar drugs but have no known clinical advantage over omeprazole. Esomeprazole (Nexium) is a newer preparation containing only the active isomer of omeprazole.
Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Chronic suppression of acid secretion has caused hypergastrinaemia in laboratory animals, leading to mucosal cell hyperplasia, rugal hypertrophy and the development of carcinoids, and so treatment for a maximum of 8 weeks has been recommended. However, such problems have not been reported in companion animals. Adverse effects do include nausea, diarrhoea, constipation and skin rashes. An i.v. preparation of rabeprazole causes pulmonary oedema in dogs at high doses.

Drug interactions: Omeprazole may enhance the effects of phenytoin.

DOSES

**Dogs**: 0.5-1.5 mg/kg i.v., p.o., q24h for a maximum of 8 weeks.

**Cats**: 0.75-1 mg/kg p.o. q24h for a maximum of 8 weeks.

**Small mammals**: Ferrets: 0.7-4 mg/kg p.o. q24h for a maximum of 8 weeks.

**Birds, Reptiles**: No information available.

Ondansetron (Zofran*) POM

Formulations: Injectable: 2 mg/ml solution in 2 ml and 4 ml ampoules. Oral: 4 mg, 8 mg tablets; 4 mg/5 ml syrup. Rectal: 16 mg suppositories.

Action: Potent anti-emetic effects through action on the GI tract and the chemoreceptor trigger zone. It was developed for, and is particularly useful in, the control of emesis induced by chemotherapeutic drugs. However, recent work suggests its potency at canine 5-HT3 receptors is one tenth that in humans.

Use: Indicated for the management of nausea and vomiting in patients who are unable to tolerate, or whose signs are not controlled by, other drugs (e.g. maropitant). Dolasetron (Anzemet), granisetron (Kytril), palonosetron (Aloxi) and tropisetron (Navoban) are similar drugs but have yet to be extensively used in companion animals.

Safety and handling: Normal precautions should be observed.

Contraindications: Intestinal obstruction.

Adverse reactions: In humans, constipation, headaches, occasional alterations in liver enzymes and, rarely, hypersensitivity reactions have been reported.

Drug interactions: No information available.

DOSES

**Dogs, Cats**: 0.5 mg/kg i.v. loading dose followed by 0.5 mg/kg/h infusion for 6 hours or 0.5-1 mg/kg p.o. q12-24h.

**Small mammals, Birds, Reptiles**: No information available.
Orbifloxacin (Orbax) POM-V

**Formulations:** Oral: 6.25 mg, 25 mg, 75 mg tablets.

**Action:** Bactericidal, inhibiting DNA gyrase. Action is concentration-dependent, meaning that pulse dosing regimens may be effective.

**Use:** Broad spectrum agent. Particularly active against mycoplasmas, many Gram-negative organisms and some Gram-positives including *Pasteurella* spp., *Staphylococcus* spp., *Pseudomonas aeruginosa*, *Klebsiella* spp., *Escherichia coli*, *Proteus* spp. and *Salmonella* spp. The fluoroquinolones are effective against beta-lactamase-producing bacteria. Orbifloxacin is ineffective in treating obligate anaerobic infections. It is a highly lipophilic drug, attaining high concentrations within cells in many tissues and is particularly effective in the management of soft tissue, urogenital (including prostatic) and skin infections. Caution should be exercised before using dose rates above those recommended by the manufacturer.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Due to concerns regarding cartilage damage, orbifloxacin is contraindicated in giant breed dogs <18 months, large breeds <12 months and small and medium breeds <8 months. Should not be used in pregnant or lactating bitches or animals for breeding. Do not use with oral cyclosporin.

**Adverse reactions:** Cartilage abnormalities have been reported with other fluoroquinolones in growing animals. Such abnormalities have not been specifically reported following the use of orbifloxacin. These drugs should be used with caution in epileptics until further information is available from dogs, as they potentiate CNS adverse effects when administered concurrently with NSAIDs in humans. The potential adverse effects of orbifloxacin on the canine retina have not been studied (see Enrofloxacin).

**Drug interactions:** Absorbents and antacids containing cations \( \text{Mg}^{2+}, \text{Al}^{3+} \) may bind fluoroquinolones, preventing their absorption from the GI tract. Their absorption may also be inhibited by sucralfate and zinc salts; separate dosing by at least 2 hours. Fluroquinolones increase plasma theophylline concentrations. Cimetidine may reduce the clearance of fluoroquinolones and so should be used with caution with these drugs.

**DOSES**

* Dogs: 2.5-7.5 mg/kg p.o. q24h.
* Cats, Small mammals, Birds, Reptiles: No information available.

Osaterone (Ypozane) POM-V

**Formulations:** Oral: 1.875 mg, 3.75 mg, 7.5 mg, 15 mg tablets.

**Action:** Competitively prevents the binding of androgens to their prostatic receptors and blocks the transport of testosterone into the prostate.
**Use:** Treatment of benign prostatic hypertrophy (BPH) in male dogs. In dogs with BPH associated with prostatitis, osaterone can be administered concurrently with antimicrobials.

**Safety and handling:** Women of child-bearing age should avoid contact with, or wear disposable gloves, when administering the product.

**Contraindications:** Use with caution in dogs with a history of liver disease, as safety in these dogs has not been thoroughly investigated and treatment of some dogs with liver disease has resulted in reversible increases in ALT and ALP.

**Adverse reactions:** A transient reduction of plasma cortisol concentration may occur; this may continue for several weeks after administration. Appropriate monitoring should be implemented in dogs under stress (e.g. following surgery) or those with hypoadrenocorticism. The response to an ACTH stimulation test may also be suppressed for several weeks after administration of osaterone. Transient increases in appetite and changes in behaviour occur commonly. Other adverse reactions include transient vomiting and/or diarrhoea, polyuria/polydipsia, lethargy and feminization syndrome including mammary gland hyperplasia.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 0.25-0.5 mg/kg q24h for 7 days.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Oxantel see Pyrantel**

**Oxazepam** (Oxazepam*) POM CD Schedule 2

**Formulations:** Oral: 10 mg, 15 mg, 30 mg tablets.

**Action:** Centrally acting anxiolytic benzodiazepine; precise mechanism unknown.

**Use:** Has been used as an appetite stimulant, particularly where cyproheptadine is unsuccessful. May be useful in behavioural cases but specialist advice should be obtained. GI absorption is slow and onset of effects may therefore be delayed. Metabolism of oxazepam in cats is poorly understood. Although there are no reports detailing hepatic necrosis (as seen in a small percentage of cats with oral diazepam) it should not be used as a first line appetite stimulant.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Liver disease.

**Adverse reactions:** Additive effects are seen with concurrent use of other CNS depressants. Sedation and occasional ataxia may occur but are usually transient.

**Drug interactions:** Metabolism of oxazepam may be decreased and excessive sedation may occur if given with cimetidine, erythromycin,
ketoconazole, propranolol or valproic acid. This effect is less likely with oxazepam than other benzodiazepines (e.g. diazepam), as oxazepam undergoes glucuronide conjugation. Benzodiazepines may decrease the thyroidal uptake of radioactive iodine.

DOSES

Dogs:
- Appetite stimulation: 0.2-0.4 mg/kg p.o. q24h.
- Anxiolytic: 0.2-0.5 mg/kg p.o. q12-24h.

Cats: 0.2-0.4 mg/kg p.o. q24h. Not to exceed 2 mg total dose in 24 h.

Small mammals, Birds, Reptiles: No information available.

Oxypentifylline see Pentoxifylline

Oxymetazoline (Afrazine*) P

Formulations: Paediatric nasal drops: 0.025% solution.

Action: A sympathomimetic drug that reduces blood flow to the turbinates and therefore reduces swelling of the nasal mucosa.

Use: Nasal decongestant in cases of allergic (lymphocytic) rhinitis. May also be of some use in ‘cat flu’. As the effects of the drug wear off, a rebound phenomenon develops due to secondary vasodilation. This results in a subsequent temporary increase in nasal congestion. Xylometazoline is similar to oxymetazoline.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: No information available.

Drug interactions: No information available.

DOSES

Dogs, Cats: 1 drop/nostril q12h for maximum 48 hours.

Small mammals, Birds, Reptiles: No information available.

Oxytetracycline (Engemycin, Oxycare) POM-V

Formulations: Injectable: 50 mg/ml solution. Oral: 50 mg, 100 mg, 250 mg tablets. Feed supplement and soluble powders also available.

Action: Inhibits bacterial protein synthesis. The effect is bacteriostatic.

Use: Active against many Gram-positive and Gram-negative bacteria, rickettsiae, mycoplasmas, spirochaetes and other microbes. One of the less lipid-soluble tetracyclines, it is excreted unchanged in urine and bile and undergoes enterohepatic recirculation. Has been used in combination with nicotinamide in the management of immune-mediated conditions, including discoid lupus erythematosus and lupoid onychodystrophy. Resistance to tetracyclines is widespread.
**Safety and handling:** Normal precautions should be observed. **Contraindications:** The concentrated injectable depot formulations used for cattle and sheep should never be given to small animals. Avoid oral dosing in birds, other than for prophylaxis, as tetracyclines are poorly absorbed from the GI tract, rapidly lose potency in drinking water and put birds off drinking water due to their taste. Only use in cats when no other agent is suitable. **Adverse reactions:** Include vomiting, diarrhoea, depression, hepatotoxicity (rare), fever, hypotension (following i.v. administration) and anorexia (cats). Prolonged use may lead to development of superinfections. Oral tetracyclines may cause GI disturbances and death in guinea pigs. Although not well documented in veterinary medicine, tetracyclines induce dose-related functional changes in renal tubules in several species, which may be exacerbated by dehydration, haemoglobinuria, myoglobinuria or concomitant administration of other nephrotoxic drugs. Severe tubular damage has occurred following the use of outdated or improperly stored products and occurs due to the formation of a degradation product. Tetracyclines stain the teeth of children when used in the last 2-3 weeks of pregnancy or the first month of life. Although this phenomenon has not been well documented in animals, it does occur in dogs and it is prudent to restrict the use of tetracyclines in all young animals. Injectable preparations in birds may cause toxicity or muscle necrosis. **Drug interactions:** The bactericidal action of penicillins may be inhibited by oxytetracycline. Antacids containing divalent or trivalent cations (Mg²⁺, Ca²⁺, Al³⁺), food or milk products bind tetracycline, reducing its absorption. Tetracyclines may increase the nephrotoxic effects of methoxyflurane. The GI effects of tetracyclines may be increased if administered concurrently with theophylline products.**DOSES**

**Dogs:** 7-11 mg/kg i.m., s.c. q24h; 10-20 mg/kg p.o. q8h. Give oral dose on an empty stomach.  
**Cats:** 7-11 mg/kg i.m., s.c. q24h.  
**Small mammals:** Ferrets, Hamsters, Gerbils: 20 mg/kg i.m. q12h; Rabbits: 15 mg/kg i.m. q12h; Chinchillas: 15 mg/kg i.m. q12h; 50 mg/kg q12h p.o.; Guinea pigs: 5 mg/kg i.m. q12h; Rats: 20 mg/kg i.m. q8-12h, 10-20 mg/kg q8h p.o.; Mice: 100 mg/kg s.c. q12h; 10-20 mg/kg q8h p.o.  
**Birds:** Raptors: 25-50 mg/kg p.o. q8h; Parrots: 50 mg/kg i.m. q24h; 200 mg/kg i.m. q24h – long-acting preparations; Passerines: 100 mg/kg p.o. q24h or 4-12 mg/l water for 7 days; Pigeons: 50 mg/kg p.o. q6h or 80 mg/kg i.m. q48h (long-acting prep) or 130-400 mg/l water.  
**Reptiles:** No information available.
Oxytocin (Oxytocin Leo, Oxytocin S, Pituitary extract (synthetic))
POM-V

**Formulations:** Injectable: 10 IU/ml solution.

**Action:** Synthetic oxytocin.

**Use:** Induces parturition when uterine inertia is present (as long as there is no uterine obstruction); evacuates uterine contents; decreases haemorrhage following parturition; and promotes milk ‘let-down’. Before oxytocin is used in any species it is important to ensure that there is no evidence of obstructive dystocia and that blood calcium levels are adequate. Calcium supplementation should be administered 1 hour prior to oxytocin if ionized or total blood calcium levels are low.

**Safety and handling:** Store in refrigerator.

**Contraindications:** Not recommended for use in egg retention in birds.

**Adverse reactions:** Overstimulation of the uterus can be hazardous to both mother and fetuses. In birds it can cause painful side effects due to stimulation of smooth muscle.

**Drug interactions:** Severe hypertension may develop if used with sympathomimetic pressor amines.

**DOSES**

**Dogs:**
- Obstetric indications: 2-10 IU i.m., s.c.
- Milk let-down 2-20 IU i.m., s.c.

**Cats:**
- Obstetric indications: 2-5 IU i.m., s.c.
- Milk let-down: 1-10 IU i.m., s.c.

**Small mammals:** Rodents: 0.2-3 IU/kg s.c., i.m i.v.; Mice (milk let-down) 6.25 IU/kg s.c.

**Birds:** Do not use.

**Reptiles:** Egg retention: 2-10 IU/kg i.m. q90min; maximum of 3 doses.

P07P (Phytopica) GSL

**Formulations:** Oral: 2 g, 7.5 g sachets of Glycyrrhiza uralensis, Paeonia lactiflora and Rehmannia glutinosa.

**Action:** Anti-inflammatory.

**Use:** For the long-term management of atopic dermatitis. Beneficial effects should be seen in the first month of treatment.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Diarrhoea, flatulence.
Drug interactions: No information available.
DOSES
Dogs: 200 mg/kg p.o. q24h.
Cats, Small mammals, Birds, Reptiles: No information available.

Pamidronate (Aredia*, Pamidronate*) POM
Formulations: Injectable: 15 mg, 30 mg, 90 mg powders in vials for reconstitution and i.v. infusion.
Action: Inhibits osteoclast activity.
Use: Treatment of acute moderate to severe hypercalcaemia when other therapeutic regimens are ineffective. In human medicine it is also used to treat osteolytic lesions and bone pain due to bone metastases associated with breast cancer, multiple myeloma and Paget’s disease.
Safety and handling: Normal precautions should be observed.
Contraindications: Renal dysfunction.
Adverse reactions: Nausea, diarrhoea, hypocalcaemia, hypophosphataemia, hypomagnesaemia and hypersensitivity reactions.
Drug interactions: Concurrent use of aminoglycosides may result in severe hypocalcaemia.
DOSES
Dogs: 0.9-1.3 mg/kg i.v. infusion over 24h.
Cats: 1.5-2.0 mg/kg i.v. infusion over 24h.
Small mammals, Birds, Reptiles: No information available.

Pancreatic enzyme supplements (Tryplase, Lypex*, Pancreatic Enzyme Supplement for Dogs and Cats (formerly Pancrex)*, Panzym*, Pancrex Granules*, Pancrex V*) AVM-GSL, POM, P
Formulations: Oral: See table in Appendix. Note that Tryplase is the only formulation that is authorized for veterinary use, although others are marketed as nutraceuticals in the veterinary market. Many other formulations on human market.
Action: Exogenous replacement enzymes.
Use: Pancreatic enzymes (lipase, protease, amylase) are used to control signs of exocrine pancreatic insufficiency. They may also be indicated in non-specific diarrhoea, but a definitive diagnosis should be sought. Fresh raw, or fresh-frozen, pig pancreas (approximately 100 g per meal) is also an effective treatment (and is not a Specified Risk Material) but availability is limited and there is a risk of pathogen ingestion by this method. Enteric-coated preparations are less
effective than powdered non-enteric coated pancreatic extracts. Lypex is enteric coated but has not been fully evaluated. Trypase capsules are opened and their contents sprinkled on the food; do not administer whole capsules. Use the manufacturer’s recommendations as the minimum required initially; the dose may be reduced empirically once a satisfactory response is achieved. Efficacy may be augmented by antibiotic control of secondary bacterial overgrowth. Concomitant administration of acid blockers is not cost-effective.

**Safety and handling:** Powder spilled on hands should be washed off or skin irritation may develop. Avoid inhaling powder as it causes mucous membrane irritation and may trigger asthma attacks in susceptible individuals.

**Contraindications:** No information available.

**Adverse reactions:** High doses may cause diarrhoea and GI cramping. Contact dermatitis of the lips is occasionally seen with powdered enzyme, and some dogs develop an offensive odour.

**Drug interactions:** The effectiveness may be diminished by antacids (magnesium hydroxide, calcium carbonate).

**DOSES**

**Dogs:** Tryplase: the contents of 2-5 capsules per day sprinkled on food; 5 capsules are sufficient to digest 500 g of dog food. Alternatively, at least 1-1.5 teaspoonfuls of powdered non-enteric-coated pancreatic extract per 100 g of food or per 10 kg body weight per meal. Mix thoroughly with food. Best results are usually obtained by feeding only 2 or 3 meals/day.

**Cats:** Tryplase: the contents of 1-2 capsules per day sprinkled on food; 2 capsules are sufficient to digest 250 g of cat food. Alternatively, 1 teaspoonful of powdered non-enteric-coated pancreatic extract mixed thoroughly with each meal. Adjust dose as necessary.

**Birds:** One capsule/kg bodyweight q24h mixed in food.

**Small mammals, Reptiles:** No information available.

**Pancuronium** (Pancuronium*) POM

**Formulations:** Injectable: 2 mg/ml solution.

**Action:** Inhibits the actions of acetylcholine at the neuromuscular junction by binding competitively to the nicotinic acetylcholine receptor on the post-junctional membrane.

**Use:** Provision of neuromuscular blockade during anaesthesia. This may be to improve surgical access through muscle relaxation, facilitate positive pressure ventilation, or for intraocular surgery. Medium to long duration of action (> 45 min), although there is marked variation between individuals. Can also have a modest stimulatory effect on the cardiovascular system. Monitoring (using a nerve stimulator) and reversal of the neuromuscular blockade is
recommended to ensure complete recovery before the end of anaesthesia. Hypothermia, acidosis and hypokalaemia will prolong the duration of action of neuromuscular blockade. Neostigmine is preferred to edrophonium as the reversal agent because of the potency and duration of action of pancuronium.

**Safety and handling:** Store in refrigerator.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available.

**Adverse reactions:** No information available.

**Drug interactions:** Neuromuscular blockade is more prolonged when pancuronium is given in combination with volatile anaesthetics, aminoglycosides, clindamycin and lincomycin.

**DOSES**

**Dogs, Cats:** 0.05-0.1 mg/kg i.v.; initially use a higher dose and repeat doses at increments of 0.01 mg/kg. Repeated doses may be cumulative and lead to difficulty in antagonism.

**Small mammals, Birds, Reptiles:** No information available.

---

**Papaveretum** (*Papaveretum*, *Omnopon*) POM CD **SCHEDULE 2**

**Formulations:** Injectable: 7.7 mg/ml, 15.4 mg/ml papaveretum solutions; 15.4 mg/ml papaveretum and 0.4 mg/ml hyoscine (scopolamine) solution. 7.7 and 15.4 mg/ml solutions provide the equivalent of 5 mg and 10 mg anhydrous morphine per ml, respectively.

**Action:** Analgesia mediated by the OP3 opioid receptor.

**Use:** Management of moderate to severe pain in the perioperative period. Incorporation into sedative and pre-anaesthetic medication protocols (see Appendix) to provide improved sedation and analgesia. Papaveretum is a mixture of the alkaloids of opium containing the equivalent of anhydrous morphine 85.5%, anhydrous codeine 6.8% and papaverine 7.8%. It has a similar effect to morphine, with an onset of action of 15-60 min, and is thought to have a duration of action of 4 hours. Papaveretum is not widely used to provide postoperative analgesia in dogs and cats and tends to be used in combination with phenothiazine to provide good sedation in aggressive dogs. It has not been widely evaluated in experimental or clinical analgesia studies.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In common with other OP3 agonists papaveretum can cause respiratory depression, although this is unlikely when used at clinical doses in awake cats and dogs. Respiratory depression may occur when morphine is given i.v. during general anaesthesia, due to the increased depth of anaesthesia that
accompanies administration. Respiratory function should be monitored when it is given to anaesthetized patients. Vomiting is common after papaveretum administration. It causes constriction of GI sphincters (such as the pyloric sphincter) and may cause a reduction in GI motility when given over a long period. The response to all opioids appears to be very variable between individual patients, therefore assessment of pain after administration is imperative. Papaveretum is metabolized in the liver, some prolongation of effect may be seen with impaired liver function. Papaveretum crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Severe adverse effects can be treated with naloxone.

**Drug interactions:** Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillizers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics.

**DOSES**
*Dogs:* 0.2 to 0.8 mg/kg i.m., s.c.; only use higher doses when deep sedation required.
*Cats:* 0.2-0.3 mg/kg i.m., s.c.
*Small mammals, Birds, Reptiles:* No information available.

**Paracetamol (Acetaminophen) (Paracetamol, Pardale V (paracetamol and codeine phosphate)) P, POM, POM-V**

**Formulations:** Oral: 500 mg tablet; 120 mg/5 ml, 250 mg/5 ml suspensions; 400 mg paracetamol and 9 mg codeine phosphate tablet (Pardale V).

**Action:** It has been proposed that its antipyretic actions are due to prostaglandin synthesis within the CNS; however its exact mechanism of action is unclear.

**Use:** Control of mild to moderate pain and as an antipyretic. Paracetamol has poor anti-inflammatory effects. It produces few GI side effects and can be administered to patients with gastric ulceration. The therapeutic margin of paracetamol is low in dogs and, due to the strength of the tablets, the risk of overdose is high. There are better alternative analgesic, antipyretic and anti-inflammatory drugs authorized for dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in cats as they lack the glucuronyl transferase enzymes required to metabolize the drug.

**Adverse reactions:** Overdose of paracetamol causes liver damage through the production of N-acetyl-p-aminobenzoquinonimine during metabolism, which causes hepatocyte cell death and centrilobular hepatic necrosis. Treatment of overdose with oral methionine or i.v. acetylcysteine is directed at replenishing hepatic glutathione.
Drug interactions: Metoclopramide enhances absorption of paracetamol, thereby enhancing its effects.

DOSES

Dogs: 10 mg/kg p.o. q12h.

Cats: Do not use.

Small mammals: Rodents: 1-2 mg/ml of drinking water (use flavoured products).

Birds, Reptiles: No information available.

Paraffin (Mineral oil, Liquid paraffin) (Katalax*, Liquid paraffin oral emulsion*, Lacri-Lube*, Lubri-Tears*, Simple Eye Ointment*)

Formulations: Oral: White soft paraffin paste (Katalax); liquid paraffin (50/50 oil/water mix). Topical: 3.5 g, 4 g or 5 g ophthalmic ointment.

Action: Paraffin is a laxative; it softens stool by interfering with intestinal water resorption.

It is also a lipid-based tear substitute that mimics the lipid portion of the tear film and helps prevent evaporation of tears.

Use: Paraffin is used to manage constipation. It is beneficial in the management of keratoconjunctivitis sicca, during general anaesthesia and for eyelid paresis. It is a long-acting ocular lubricant and is used when frequency of treatment is not easy.

Safety and handling: Normal precautions should be observed.

Contraindications: Not to be given orally in patients with a reduced gag reflex.

Adverse reactions: As paraffin is tasteless, normal swallowing may not be elicited if syringing orally; thus inhalation and subsequent lipid pneumonia are a significant risk. Paraffin ointment may blur vision, although not often a problem in dogs/cats.

Drug interactions: Reduced absorption of fat-soluble vitamins may follow prolonged use.

DOSES

Dogs:
- Constipation: 1-2 tablespoons per meal as required.
- Ocular: Apply to eye at night or q6-12h prn.

Cats:
- Constipation: Adults 1 inch Katalax paste p.o. q12-24h; kittens 1/2 inch Katalax paste p.o. q12-24h.
- Ocular: Apply to eye at night, or q6-12h prn.

Small mammals, Birds, Reptiles: No information available.
Paroxetine (Seroxat*) POM

Formulations: Oral: 20 mg, 30 mg tablets, 2 mg/ml liquid suspension.

Action: Blocks serotonin re-uptake in the brain, resulting in antidepressive activity and a raising in motor activity thresholds.

Indications: Treatment of generalized anxiety in dogs and urine marking with overt aggression in cats. The atypical tricyclic antidepressant clomipramine is authorized for use in dogs.

Contraindications: Known sensitivity to paroxetine or other SSRIs, history of seizures.

Adverse reactions: Possible reactions include lethargy, decreased appetite and vomiting. Trembling, restlessness, GI disturbance and an apparent paradoxical increase in anxiety may occur in some cases. Owners should be warned of a potential increase in aggression in response to medication and frequency of urination should be monitored when used in cats.

Drug interactions: Paroxetine should not be used within 2 weeks of treatment with an MAOI (e.g. selegiline) and an MAOI should not be used within 6 weeks of treatment with paroxetine. Paroxetine, like other SSRIs, antagonizes the effects of anticonvulsants and so is not recommended for use with epileptic patients or in association with other agents which lower seizure threshold, e.g. phenothiazines. Caution is warrant if paroxetine is used concomitantly with aspirin or other anticoagulants, since the risk of increased bleeding in the case of tissue trauma may be increased.

DOSES

Dogs: 0.5-2 mg/kg p.o. q24h.
Cats: 0.25-0.5 mg/kg p.o. q24h.

Small mammals, Birds, Reptiles: No information available.

Penicillamine (Distamine*, Penicillamine*) POM

Formulations: Oral: 125 mg, 250 mg tablets.

Action: Penicillamine is an orally administered chelating agent that binds copper, mercury and lead. It also binds to cystine.

Use: In dogs has mostly been used for treating copper-associated hepatopathy in Bedlington Terriers and other susceptible breeds, and for oral treatment of lead poisoning. It has also been used in the treatment of primary biliary cirrhosis and idiopathic chronic active hepatitis. It is used in cystinuria as it decreases cystine excretion by combining with cystine to form the soluble complex cystine-o-penicillamine disulphide). May be used in the management of lead toxicity, especially in birds, when injecting EDTA is too difficult or long-term chelation is required. It has a low therapeutic index in birds. Dogs that fail to tolerate even the lower dose regimes may be pretreated with antiemetic drugs (phenothiazines or antihistamines) 30-60 min before penicillamine. Penicillamine is used for treating
rheumatoid arthritis in humans, but has not yet been used in immune-mediated erosive arthropathies in companion animals.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Severe renal impairment.

**Adverse reactions:** Anorexia, vomiting, pyrexia and nephrotic syndrome are seen in dogs. Serious adverse effects that have been described in humans given penicillamine include leucopenia, thrombocytopenia, skin rashes and lupus-like reactions. May cause vomiting, hypoglycaemia and death in birds.

**Drug interactions:** The absorption of penicillamine is decreased if administered with antacids, food, or iron or zinc salts. An increase in the renal and haematological effects of penicillamine have been recorded in humans receiving it with cytotoxic drugs.

**DOSES**

**Dogs:**
- Copper-associated hepatitis in Bedlington Terriers: 125-250 mg p.o. q24h given on an empty stomach 30 min before feeding. Must be given for months to be effective.
- Chronic hepatitis: 10-15 mg/kg p.o. q12h.
- Cystinuria: 10-15 mg/kg p.o. q12h.
- Lead poisoning: Patients commonly receive CaEDTA before receiving penicillamine at 100-110 mg/kg p.o. q24h on an empty stomach for 1-2 weeks. Stop treatment for 1 week and resume until blood lead levels are normal (at end of 'rest' week). If adverse effects occur, the daily dose may be divided and given q6-8h or reduced to 33-55 mg/kg p.o. q24h.

**Birds:** Lead poisoning: 55 mg/kg p.o. q12h.

**Cats, Small mammals, Reptiles:** No information available.

**Penicillin G** (Benzyl penicillin) (Crystapen, Depocillin, Duphapen, Neopen) POM-V

**Formulations:** Injectable: comes in a variety of salts (sodium, procaine and benzathine) which affect solubility. Penicillin G sodium (highly soluble): 3 g powder for reconstitution for i.v. use; Procaine penicillin (less soluble): 300 mg/ml suspension for s.c use, slower release.

**Action:** Binds to penicillin-binding proteins involved in cell wall synthesis, decreasing bacterial cell wall strength and rigidity, and affecting cell division, growth and septum formation. As animal cells lack a cell wall the beta-lactam antibiotics are safe. Kills bacteria in a time-dependent fashion.

**Use:** A beta-lactamase-susceptible antimicrobial. Narrow spectrum of activity and susceptible to acid degradation in the stomach. Used parenterally to treat infections caused by sensitive organisms (e.g. *Streptococcus* spp., *Clostridium* spp., *Borrelia burgdorferi,*
fusospirochaetes). The sodium salt is absorbed well from s.c. or i.m. sites. Procaine penicillin is sparingly soluble, providing a ‘depot’ from which it is slowly released. When used for ‘blind’ therapy of undiagnosed infections, penicillins may be given in conjunction with an aminoglycoside such as gentamicin with or without metronidazole. As penicillin kills in a time-dependent fashion, it is important to maintain tissue concentrations above the MIC for the organism throughout the interdosing interval.

**Safety and handling:** After reconstitution penicillin G sodium is stable for 7 days if refrigerated, 24 hours if not.

**Contraindications:** Do not administer penicillins to hamsters, gerbils, guinea pigs or chinchillas. Use with caution in rabbits though it has been used long term for treatment of abscesses and osteomyelitis. Do not use in animals sensitive to beta-lactam antimicrobials. Procaine is toxic to rats and mice.

**Adverse reactions:** 600 mg of penicillin G sodium contains 1.7 mEq of Na+. This may be clinically important for patients on restricted sodium intakes. The i.m. administration of >600 mg/ml may cause discomfort. Patients with significant renal or hepatic dysfunction may need dosage adjustment.

**Drug interactions:** Avoid the concomitant use of bacteriostatic antibiotics. The aminoglycosides may inactivate penicillins when mixed in parenteral solutions *in vitro*, but they act synergistically when administered at the same time *in vivo*. Procaine can antagonize the action of sulphonamides and so procaine penicillin G should not be used with them.

**DOSES**

**Dogs, Cats:** Penicillin G sodium: 15-25 mg/kg i.v., i.m. q4-6h; Penicillin G procaine: 30 mg/kg s.c. q24h.

**Small mammals:** Ferrets: 20 mg/kg i.m. q12h; Rabbits: 40 mg/kg s.c. once every 7 days (x 3 doses) for *Treponema cuniculi*; other infections 40 mg/kg s.c. q24h; Rats (not procaine): 22 mg/kg q24h s.c., i.m.; Chinchillas, Guinea pigs, Gerbils, Hamsters: Do not use.

**Birds, Reptiles:** No information available.

---

**Pentamidine isethionate** (Pentacarinat*) POM

**Formulations:** Injectable: 300 mg vials of powder for reconstitution.

**Action:** Kills protozoans by interacting with DNA. It is rapidly taken up by the parasites by a high-affinity energy-dependent carrier.

**Use:** Treatment of leishmaniasis when resistance to the pentavalent antimony drugs (meglumine antimonate and sodium stibogluconate) has occurred. Never give by rapid i.v. injection due to cardiovascular effects. Pentamidine is a toxic drug and the potential to cause toxic damage to kidney and liver in particular should be carefully considered prior to use.
Safety and handling: Care should be taken by staff handling this drug as it is a highly toxic agent. Similar precautions to those recommended when handling cytotoxic agents used in cancer chemotherapy should be taken.

Contraindications: Impaired liver or kidney function.

Adverse reactions: Pain and necrosis at the injection site, hypotension, nausea, salivation, vomiting and diarrhoea. Hypoglycaemia and blood dyscrasias are also reported in humans.

Drug interactions: No information available.

DOSES

**Dogs:** 3-4 mg/kg i.m. on alternate days for a maximum of 10 treatments. Never give by rapid i.v. injection. Seek expert advice before treating leishmaniasis.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Pentazocine** (Talwin*, Pentazocine*) POM CD Schedule 3

**Formulations:** Oral: 25 mg tablet, 50 mg capsule. Injectable: 30 mg/ml solution.

**Action:** Weak agonist effect at OP2 receptors and antagonistic effects at the OP3 receptor.

**Use:** Short-term management of mild to moderate pain in dogs. Incorporation into sedative and pre-anaesthetic medication protocols to provide improved sedation and analgesia. After i.v. injection it has a rapid onset (2-5 min) and short duration (45-60 min) of action. It will antagonize the effects of morphine and other opioids through an antagonistic effect at the OP3 receptor, but will also provide analgesia through an action at OP2 receptors. Has little effect on the GI tract and causes less respiratory depression than morphine. Unlike most other opioids it can increase heart rate. Oral pentazocine is rarely used in cats and dogs due to a high first pass metabolism leading to a low plasma concentration after oral administration.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in cases with severe pain or where severe pain is anticipated. Full OP3 agonist opioids are preferred in such cases.

**Adverse reactions:** Rapid i.v. injection alone or with acepromazine may cause marked excitement.

**Drug interactions:** In common with other opioids, pentazocine will reduce the doses of other drugs required for induction and maintenance of anaesthesia. Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillizers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics. Administration of pentazocine will reduce analgesia produced from full OP3 agonists (therefore avoid including pentazocine in premedication when administration of potent opioids during surgery is anticipated).
DOSES

Dogs: 1-3 mg/kg i.m., 2-6 mg/kg p.o. repeated q3-4h depending on pain assessment.
Cats: Do not use.
Small mammals: Rodents: 5-10 mg/kg s.c. q2-4h prn.
Birds, Reptiles: No information available.

Pentobarbital (Pentobarbitone) (Dolethal, Euthatal, Lethobarb, Pentobarbital Solution 20% for Euthanasia, Pentoject) POM-V CD

Formulations: Injectable: 200 mg/ml, as either a blue or yellow non-sterile aqueous solution.

Action: CNS depressant.

Use: For euthanasia of cats, dogs and other small animals. When it is predicted that euthanasia may be problematical (e.g. aggressive patients) it is recommended that premedication with an appropriate sedative is given. The animal should be restrained in order to forestall narcotic excitement until anaesthesia supervenes. This is particularly important with cats. The route of choice is i.v. if possible, but alternatives such as intraperitoneal (preferred) or intrathoracic are possible when venepuncture is difficult to achieve. The intrathoracic route is usually the last resort. There is a risk of injection into the lungs, which causes coughing and distress. Direct injection into a chamber of the heart is rapid, but it may be difficult to locate the heart chambers accurately and repeated attempts could cause unnecessary pain and distress. There is no authorized pentobarbital product in the UK that is suitable for the emergency control of seizures. Do not use solutions intended for euthanasia to try to control seizures. Phenobarbital given i.v. is as effective as the pentobarbitone solutions that used to be available for the control of seizures.

Safety and handling: Normal precautions should be observed.

Contraindications: Should not be given i.m. as it is painful and slow to act. Do not use solutions intended for euthanasia to try to control seizures.

Adverse reactions: Narcotic excitement may be seen with agitated animals. Agonal gasping is sometimes seen.

Drug interactions: Antihistamines and opioids increase the effect of pentobarbital.

DOSES

Dogs, Cats:

- Euthanasia: 150 mg/kg i.v.
- Status epilepticus: Aliquots of 3 mg/kg i.v. q90s to a maximum of 6 doses until the seizure is controlled. Anaesthesia is not necessary. Repeat q4-8h prn.
**Small mammals:** Euthanasia: 150 mg/kg i.v., i.p. as rapidly as possible or to effect.

**Birds:** 150 mg/kg i.v., i.p.

**Reptiles:** 60-100 mg/kg i.v. or intracoelomically.

**Pentobarbitone** see **Pentobarbital**

**Pentosan polysulphate** (Cartrophen) POM-V

**Formulations:** Injectable: 100 mg/ml solution.

**Action:** Semi-synthetic polymer of pentose carbohydrates with heparin-like properties that binds to damaged cartilage matrix comprising aggregated proteoglycans and stimulates the synthesis of new aggregated glycosaminoglycan molecules. Ability to inhibit a range of proteolytic enzymes may be of particular importance. Modulates cytokine action, stimulates hyaluronic acid secretion, preserves proteoglycan content and stimulates articular cartilage blood flow, resulting in analgesic and regenerative effects.

**Use:** Disease modifying agent that reduces the pain and inflammation associated with osteoarthritis. Administered by aseptic s.c. injection, using an insulin syringe for accurate dosing. The manufacturer recommends monitoring haematocrit and total solids.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use if septic arthritis is present or if renal or hepatic impairment exists. As it may induce spontaneous bleeding, do not use in animals with bleeding disorders.

**Adverse reactions:** Pain at the injection site has been reported. Because of its fibrinolytic action the possibility of bleeding from undiagnosed tumours or vascular abnormalities exists.

**Drug interactions:** Do not use concurrently with steroids or non-steroidal drugs, including aspirin, or use concomitantly with coumarin-based anticoagulants or heparin.

**DOSES**

**Dogs:** 3 mg/kg (0.3 ml/10 kg) s.c. q5-7d on four occasions. 10-20 mg per joint intra-articularly in non-septic joints has been reported.

**Cats:** Oral formulations available in other countries have been used in cats for osteoarthritis and for chronic refractory cases of feline lower urinary tract disease. The use of the injectable form has not been well reported in this species.

**Small mammals, Birds, Reptiles:** No information available.
**Pentoxifylline** *(Oxypentifylline) (Trental®)* POM

**Formulations:** Oral: 400 mg tablet.

**Action:** Reduces blood viscosity. Anti-inflammatory through reduction of TNF-alpha production.

**Use:** Treatment of vasculitis and vasculopathies, and contact dermatitis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** GI irritation.

**Drug interactions:** There is a possible increased risk of bleeding when pentoxifylline is given with NSAIDs. Co-administration of pentoxifylline and sodium thiopental causes death from acute pulmonary oedema in rats.

**DOSES**

**Dogs:** 15 mg/kg q8-12h.

**Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Permethrin** see **Imidacloprid**

---

**Pethidine** *(Meperidine) (Demerol®, Mepiridine®, Pethidine®)* POM

CD Schedule 2

**Formulations:** Injectable: 10-50 mg/ml solutions. 50 mg/ml solution is usually used in veterinary practice.

**Action:** Analgesia mediated by the OP3 opioid receptor

**Use:** Management of mild to moderate pain. Incorporation into sedative and pre-anaesthetic medication protocols to provide improved sedation and analgesia. Pethidine has a fast onset (10-15 min) and short duration (45-60 min) of action. Frequent redosing is used for analgesia. The short duration of action may be desirable in some circumstances (e.g. when a rapid recovery is required or in animals with compromised liver function). It shares common opioid effects with morphine but also has anticholinergic effects, producing a dry mouth and sometimes an increase in heart rate. It causes less biliary tract spasm than morphine, suggesting that it may be useful for the management of pain in dogs with pancreatitis. Due to the concentration of commercially available solutions the injection volume can be 2-3 ml in large dogs, which can cause pain on i.m. injection.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not give i.v. Not advisable to use in animals at risk from histamine release (e.g. some skin allergies, asthma, mast cell tumours).
**Adverse reactions:** Histamine released during i.v. injection causes hypotension, tachycardia and bronchoconstriction. Histamine-mediated reactions may also occur after i.m. injection, resulting in local urticaria. Pethidine crosses the placenta and may exert sedative effects in neonates born to bitches treated prior to parturition. Severe adverse effects can be treated with naloxone.

**Drug interactions:** Other CNS depressants (e.g. anaesthetics, antihistamines, barbiturates, phenothiazines, tranquillizers) may cause increased CNS or respiratory depression when used concurrently with narcotic analgesics. Pethidine may produce a serious interaction if administered with monoamine oxidase inhibitors (MAOIs). The mechanism of this interaction is not clear but effects include coma, convulsions and hyperpyrexia.

**DOSES**

**Dogs:** 2-10 mg/kg i.m., s.c., q1-2h depending on pain assessment.

**Cats:** 5-10 mg/kg i.m., s.c., q1-2h depending on pain assessment.

**Small mammals:** Ferrets, Rabbits: 5-10 mg/kg i.m., s.c.; Rodents: 10-20 mg/kg i.m. q2-3h.

**Birds:** No information available.

**Reptiles:** 20 mg/kg i.m. q12-24h.

---

**Phenobarbital** (Phenobarbitone) (Epiphen, Phenobarbital, Gardenal) POM CD Schedule 3

**Formulations:** Oral: 30 mg, 60 mg tablets; 4% (40 mg/ml) solution. Injectable: 60 mg/ml and 200 mg/ml solutions.

**Action:** Thought to mediate its antiepileptic effect through enhanced responsiveness to the inhibitory postsynaptic effects of GABA, as well as inhibition of the excitatory neurotransmitter glutamate. This results in decreased monosynaptic transmission, which is thought to lead to reduced neuronal excitability and an increase in the motor cortex’s threshold for electrical stimulation.

**Use:** Initial drug of choice for the management of epileptic seizures due to idiopathic epilepsy or structural brain disease in dogs and cats. Also used adjunctively for the emergency treatment of acute epileptic seizures occurring secondary to toxic and some metabolic causes. Rapidly absorbed after oral administration in dogs; maximal plasma concentrations reached within 4-8 hours. Wide range of elimination half-lives in different dogs, from 40 to 90 hours. Steady state serum concentrations are not reached until 1-2 weeks after treatment is initiated and the full clinical effect of a dose cannot be ascertained until the steady state levels have been reached. Serum concentration should then be determined; if <15 µg/ml the dose should be increased accordingly. If seizures are not adequately controlled dose may be increased up to a maximum serum concentration of 45 µg/ml. Plasma concentrations above this level are associated with increased
hepatotoxicity. Blood samples in dogs on the higher daily doses should be determined at the same time of the day, preferably during trough periods (within 2 hours of the next dose). Trough samples are not necessary in dogs on a total daily dose of <6 mg/kg. For accuracy of dosing, dogs <12 kg should commence therapy with the oral solution formulation. With chronic therapy, induction of the hepatic microsomal enzyme system results in a decreased half-life, particularly in dogs. As a result, the dose may need to be increased. Trough phenobarbital levels should be assessed every 6-12 months.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer to animals with impaired hepatic function. Not for use in pregnant animals and nursing bitches. Do not use to control seizures resulting from hepatic disease (e.g. portosystemic shunt), hypoglycaemia or toxic causes where the clinical signs are mediated through the GABA channels (ivermectin and moxidectin toxicity) as this may exacerbate the seizures.

**Adverse reactions:** Sedation, ataxia, polyphagia and PU/PD. Polyphagia and PU/PD are likely to persist throughout therapy. Ataxia and sedation occur commonly following initiation of therapy but usually resolve within 1 week, although they may continue if high doses are used. Hepatic toxicity is rare, but may occur at high serum concentrations (or as a rare idiosyncratic reaction within 2 weeks of starting treatment). Hyperexcitability has been reported in dogs on subtherapeutic dose levels. Haematological abnormalities, including neutropenia, anaemia and thrombocytopenia, may occur. Long-term administration in the absence of hepatotoxicity is associated with: moderate increase in liver size on abdominal radiographs; no change in liver echogenicity or architecture on ultrasonography; no evidence of morphological liver damage on histology; significant increase in ALP and, to a lesser extent, ALT activity; transiently decreased albumin (up to 6 months after starting therapy) and increased GGT; and no changes in AST, bilirubin or fasting bile acids. Therefore, liver function should be assessed by other parameters, in particular a bile acid assay, persistent decrease in albumin levels, serum AST, bilirubin and ultrasonographic examination of the liver. Phenobarbital treatment does not affect adrenal function tests (ACTH stimulation test and low dose dexamethasone test) despite acceleration of dexamethasone metabolism. Phenobarbital significantly decreases total T4 and free T4 and cholesterol levels tend to increase towards the upper limits of the normal range.

**Drug interactions:** The effect of phenobarbital may be increased by other CNS depressants (antihistamines, narcotics, phenothiazines). Phenobarbital may enhance the metabolism of, and therefore decrease the effect of, corticosteroids, beta-blockers, metronidazole and theophylline. Phenobarbital may decrease the absorption of griseofulvin; avoid giving them together. Barbiturates may enhance the effects of other antiepileptics. Cimetidine, ketoconazole and chloramphenicol increase serum phenobarbital concentration through inhibition of the hepatic microsomal enzyme system.
DOSES

Dogs:
- Initial therapy: 2-3 mg/kg p.o. q12h.
- Emergency management of status epilepticus or severe cluster seizures in dogs that have not been on maintenance phenobarbital: 12 mg/kg i.v. then, if required, two further doses of 3 mg/kg i.v. at 20 min intervals to a maximum total dose of 18 mg/kg. Always wait 20 min before giving additional doses as CNS levels take 20 min to respond.
- If the dog has been on maintenance phenobarbital: 2-4 mg/kg i.v. or i.m. to increase the blood levels slightly in case these were subtherapeutic. Always take a blood sample for a phenobarbital level determination first, before giving a top-up dose.

Cats: Initial therapy: 1.5-3 mg/kg p.o. q12h. Emergency management: Doses as for dogs.

Small mammals: Guinea pigs, Gerbils: 10-25 mg/kg i.v., i.p.

Birds: 3.5-7 mg/kg p.o. q12h.

Reptiles: No information available.

Phenobarbitone see Phenobarbital

Phenoxybenzamine (Dibenyline*) POM

Formulations: Oral: 10 mg capsule. Injectable: 50 mg/ml solution.

Action: An alpha-adrenergic blocker that irreversibly blocks presynaptic and postsynaptic receptors, producing a so-called chemical sympathectomy.

Use: Reflex dyssynergia/urethral spasm and the treatment of severe hypertension in animals with phaeochromocytoma prior to surgery (in conjunction with a beta-blocker). Always use phenoxybenzamine and a beta-blocker (e.g. propranolol) when treating phaeochromocytomas, as beta blockade without concurrent alpha blockade may lead to a hypertensive crisis.

Safety and handling: Normal precautions should be observed.

Contraindications: Use with extreme caution in animals with pre-existing cardiovascular disease.

Adverse reactions: Adverse effects associated with alpha-adrenergic blockade include hypotension, miosis, tachycardia and nasal congestion. There is an increased risk of a first dose hypotensive effect if administered with beta-blockers or diuretics. Phenoxybenzamine will antagonize effects of alpha-adrenergic sympathomimetic agents (e.g. phenylephrine).

Drug interactions: No information available.
DOSES

Dogs:
- Reflex dyssynergia: 0.25-1 mg/kg p.o. q8-24h for a minimum of 5 days.
- Hypertension associated with phaeochromocytoma: 0.2-1.5 mg/kg p.o. q12h for 10-14 days prior to surgery, starting at a low dosage and increasing until the hypertension is controlled. Propranolol 0.15-0.5 mg/kg p.o. q8h is administered concurrently to prevent a hypertensive crisis.

Cats: 0.5-1 mg/kg p.o. q12h for 5 days before evaluating efficacy.

Small mammals, Birds, Reptiles: No information available.

Phentolamine (Rogitine*) POM

Formulations: Injectable: 10 mg/ml solution.

Action: Competitive antagonist for alpha-1 and alpha-2 receptors, with greater affinity for alpha-1 receptors. Alpha-1 blockade results in vasodilation and hypotension, while alpha-2 blockade facilitates noradrenaline release, leading to an increase in heart rate and raised cardiac output.

Use: Emergency treatment of extravasation injuries associated with dopamine, phenylephrine or noradrenaline and in the management of hypotensive crises associated with phaeochromocytomas. Rapid onset of action (1-2 min i.v) and short duration (5-20 min).

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Pulmonary artery pressure is reduced. Vasodilation of vessels in the nasal mucosa leads to marked nasal congestion. Overdose will lead to excessive tachycardia. Phentolamine may precipitate a hypoglycaemia secondary to increased insulin secretion; monitor blood glucose after systemic administration.

Drug interactions: The hypertensive and vasoconstricting effects of adrenaline and noradrenaline are blocked by phentolamine. Enhanced hypotension when administered with many drugs.

DOSES

Dogs, Cats:
- Antidote for extravasation injuries secondary to phenylepinephrine, dopamine or noradrenaline: Dilute 5 mg of phentolamine in 10 ml of normal saline. Using a fine needle liberally infiltrate the exposed area. Immediate effects should be seen (hyperaemia); must be used within 12 hours of injury.
- Hypertension: 0.02-0.1 mg/kg i.v. bolus followed by a continuous rate infusion.

Small mammals, Birds, Reptiles: No information available.
Phenylbutazone (Companazone, Phenogel, Phenycare, Phenylbutazone) POM-V

Formulations: Oral: 100 mg, 200 mg tablets.

Action: COX-1 enzyme inhibitor, limiting prostaglandin production.

Use: Management of mild to moderate pain and inflammation in osteoarthritic conditions. Not selective for COX-2 and likely to cause more adverse effects than more selective COX-2 inhibitors. Not authorized for preoperative administration to cats and dogs.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Do not administer perioperatively until the animal is fully recovered from anaesthesia and normotensive. Liver disease will prolong the metabolism of phenylbutazone, leading to the potential for drug accumulation and overdose with repeated dosing. Administration of phenylbutazone to animals with renal disease must be carefully evaluated. Do not give to pregnant animals or animals <6 weeks of age.

Adverse reactions: GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs precipitate cardiac failure in animals with cardiovascular disease. Phenylbutazone may infrequently cause bone marrow suppression, including aplastic anaemias. It may also cause false low T3 and T4 values.

Drug interactions: Do not administer concurrently or within 24 hours of other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES

Dogs: 2-20 mg/kg i.v., i.m., p.o. q8-12h. Maximum dose 800 mg.

Cats: 6-8 mg/kg i.v., i.m., p.o. q12h.

Small mammals, Birds, Reptiles: No information available.

Phenylephrine (Phenylephrine hydrochloride*) POM

Formulations: Injectable: 1% (10 mg/ml) solution. Ophthalmic: 2.5% solution (single-dose vials), 10% solution.

Action: Alpha-1 selective adrenergic agonist that causes peripheral vasoconstriction when given i.v., resulting in increased diastolic and systolic blood pressure, a small decrease in cardiac output and an increased circulation time. Directly stimulates the alpha-adrenergic receptors in the iris dilator musculature.

Use: Used in conjunction with fluid therapy to treat hypotension secondary to drugs or vascular failure. Has minimal effects on cardiac
beta receptors. When applied topically to the eye causes vasoconstriction and mydriasis (pupil dilation). Ophthalmic uses include mydriasis prior to intraocular surgery (often in conjunction with atropine), differentiation of involvement of superficial conjunctival vasculature from deep episcleral vasculature (by vasoconstriction), and in the diagnosis of Horner’s syndrome (denervation hypersensitivity). Phenylephrine is not a cycloplegic in the dog, so its use in uveitis is limited to mydriasis to reduce posterior synechiae formation. It is inappropriate for mydriasis for diagnostic purposes as its onset is too slow in the dog (2 hours).

Safety and handling: Normal precautions should be observed.

Contraindications: Vasoconstrictors should be used with care. Although they raise blood pressure, they do so at the expense of perfusion of vital organs (e.g. kidney). In many patients with shock, peripheral resistance is already high and to raise it further is unhelpful.

Adverse reactions: These include hypertension, tachycardia and reflex bradycardia. Extravasation injuries can be serious (necrosis and sloughing) and may be treated with phentolamine.

Drug interactions: There is a risk of arrhythmias if phenylephrine is used in patients receiving digoxin or with volatile anaesthetic agents. When used concurrently with oxytocic agents the pressor effects may be enhanced, leading to severe hypertension.

DOSES

Dogs:
- Hypotension: Correct blood volume then infuse 0.01 mg/kg very slowly i.v. q15min. Continuously monitor blood pressure if possible.
- Ophthalmic use: 1 drop approximately 2 hours before intraocular surgery. 1 drop as a single dose for vasoconstriction. 1 drop to both eyes for diagnosis of Horner’s syndrome.

Cats: Ophthalmic use: as for dogs.

Small mammals, Birds, Reptiles: No information available.

Phenylpropanolamine (Diphenylpyraline) (Propalin)

POM-V

Formulations: Oral: 50 mg/ml syrup.

Action: Increases urethral outflow resistance and has some peripheral vasoconstrictive effects.

Use: Treatment of incontinence secondary to urinary sphincter incompetence. May also be useful in the management of nasal congestion. Incontinence may recur if doses are delayed or missed. The onset of action may take several days.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.
Adverse reactions: May include restlessness, aggressiveness, irritability and hypertension. Cardiotoxicity has been reported.

Drug interactions: No information available.

DOSES

Dogs, Cats: 1 mg/kg p.o. q8h or 1.5 mg/kg p.o. q12h.
Small mammals: Rabbits: 6.25-12 mg/rabbit q12h.
Birds, Reptiles: No information available.

Phenytoin (Diphenylhydantoin) (Epanutin*, Pentran*) POM

Formulations: Oral: 25 mg, 50 mg, 100 mg, 300 mg capsules; 50 mg chewable tablets; 30 mg/5 ml suspension.

Action: Diminishes the spread and propagation of focal neural discharges. Its action appears to arise from a stabilizing effect on synaptic junctions and it depresses motor areas of the cortex without depressing sensory areas.

Use: Used to control most forms of epilepsy in humans. In dogs it is metabolized very rapidly so that very high doses need to be given often, whereas cats metabolize the drug very slowly and toxicity easily develops. These undesirable pharmacokinetic properties make it an agent of second choice in veterinary medicine. Due to rapid elimination in the dog phenytoin cannot be recommended for use as a sole anticonvulsant agent and is typically used in combination with phenobarbital and other anticonvulsant agents. Hepatic function should be monitored every 6-12 months in patients on chronic therapy. Oral absorption may be enhanced and GI adverse effects may be decreased if phenytoin is given with food. Abrupt withdrawal may precipitate seizures.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use in cats.

Adverse reactions: Adverse effects include ataxia, vomiting, hepatic toxicity, peripheral neuropathy, toxic epidermal necrolysis and pyrexia.

Drug interactions: A large number of potential drug interactions are reported in human patients, in particular complex interactions with other antiepileptics. The plasma concentration of phenytoin may be increased by cimetidine, diazepam, metronidazole, phenylbutazone, sulphonamides and trimethoprim. The absorption, effects or plasma concentration of phenytoin may be decreased by antacids, barbiturates and calcium. The metabolism of corticosteroids, doxycycline, theophylline and thyroxine may be increased by phenytoin. The analgesic properties of pethidine may be reduced by phenytoin, whereas the toxic effects may be enhanced. Concomitant administration of two or more antiepileptics may enhance toxicity without a corresponding increase in antiepileptic effect.

DOSES

Dogs: 10-35 mg/kg p.o. q6-8h.
Cats: Do not use.

Small mammals, Birds, Reptiles: No information available.
Pheromones  see Dog appeasing pheromone, Feline facial fraction F3, Feline facial fraction F4

Phosphate (Toldimphos) (Foston, Addiphos, Phosphate-Sandoz) POM-V, GSL

Formulations: Injectable: 140 mg/ml phosphate (as a 20% w/v solution of toldimphos, an organically combined phosphorus preparation) (Foston), potassium sodium phosphate (contains 40 mmol phosphate, 30 mmol potassium and 30 mmol sodium in 20 ml vials). Oral: Effervescent tablets containing 1.936 g sodium acid phosphate, 350 mg sodium bicarbonate, 315 mg potassium bicarbonate equivalent to 500 mg (16.1 mmol) phosphate, 468.8 mg (20.4 mmol) sodium and 123 mg (3.1 mmol) potassium.

Action: Phosphate is essential for intermediary metabolism, DNA and RNA synthesis, nerve, muscle and red blood cell function.

Use: Hypophosphataemic states, patients on large volume i.v. fluid therapy that have inadequate intake or patients receiving parenteral nutrition. Phosphate is filtered by the kidneys but 80% is resorbed. In diabetic ketoacidotic patients a combination of potassium chloride and potassium phosphate in equal parts may be indicated to meet the patient’s potassium needs and to treat or prevent significant hypophosphataemia.

Safety and handling: Normal precautions should be observed.

Contraindications: Hyperphosphataemia, hypocalcaemia, oliguric renal failure or if significant tissue necrosis is present.

Adverse reactions: May result in hypotension, renal failure or metastatic calcification of soft tissue. Hyperkalaemia or hypernatraemia may result in patients predisposed to these abnormalities and monitoring of electrolyte profiles is needed. Overdose or administration to patients with renal compromise may lead to hyperphosphataemia.

Drug interactions: Phosphates are incompatible with metals, including calcium and magnesium.

DOSES

Dogs:
- Acute significant hypophosphataemia: 0.06-0.18 mmol/kg of potassium phosphate i.v. over 6 h, adjust according to response.
- Chronic hypophosphataemia: 140-280 mg (1-2 ml) q48h i.m., s.c. for 5-10 doses, 0.5-2 mmol phosphate/kg/day p.o.

Cats:
- Acute significant hypophosphataemia: dose as for dogs.
- Chronic hypophosphataemia: 0.5-2 mmol phosphate/kg/day p.o.

Small mammals, Birds, Reptiles: No information available.
Phosphate enema (Sodium acid phosphate) (Fleet Enema*, Fletchers’ Phosphate Enema*)

Formulations: Rectal: 133 ml tube containing 21.4 g sodium acid phosphate and 9.4 g sodium phosphate (Fleet); 128 ml tube containing 12.8 g sodium acid phosphate and 10.24 g sodium phosphate (Fletchers').

Action: Osmotic laxative.

Use: Cathartic used to initiate rapid emptying of the colon in dogs.

Safety and handling: Normal precautions should be observed.

Contraindications: Phosphate enemas are contraindicated for use in cats or small dogs (<5 kg) as they may develop electrolyte abnormalities (hypocalcaemia and hyperphosphataemia) which can be fatal.

Adverse reactions: Electrolyte abnormalities (hypocalcaemia and hyperphosphataemia) which can be fatal.

Drug interactions: No information available.

DOSES

Dogs: 60-118 ml per rectum (dogs 5-10 kg); 128 ml per rectum (dogs >10 kg).

Cats: Do not use.

Small mammals, Birds, Reptiles: No information available.

Phytomenadione see Vitamin K1

Pilocarpine (Pilocarpine hydrochloride*, Pilocarpine nitrate*, Pilogel *)

Formulations: Ophthalmic: 0.5%, 1%, 2%, 3%, 4% solutions, 4% gel. Most common concentration used in dogs is 1%.

Action: Direct-acting parasympathomimetic that stimulates cholinergic receptors. It lowers intraocular pressure by causing ciliary body muscle contraction, miosis and improved aqueous humour outflow.

Use: Pilocarpine has been used in the management of glaucoma, although this role has been superceded by other topical drugs such as carbonic anhydrase inhibitors and prostaglandin analogues. Oral (not topical) pilocarpine increases lacrimation and can be used in the management of neurogenic keratoconjunctivitis (KCS or dry eye) in the dog. Pilocarpine produces miosis in 10-15 min for 6-8 hours in the dog. Pilocarpine is rarely used for ophthalmic purposes in the cat due to potential toxicity.

Safety and handling: Normal precautions should be observed.

Contraindications: Avoid in uveitis or anterior lens luxation.
**Adverse reactions:** Conjunctival hyperaemia (vasodilation) and local irritation (due to low pH). Signs of systemic toxicity include hypersalivation, vomiting, diarrhoea and cardiac arrhythmias.

**Drug interactions:** No information available.

**DOSES**

**Dogs:**
- Open-angle glaucoma: 1 drop per eye of 1% solution q8-12h.
- Neurogenic KCS: 1 drop 1-2% solution per 10 kg p.o. q12h (with food) as initial dose. Dose is increased slowly by 1 drop until signs of systemic toxicity are observed and then lowered to previously tolerated dose.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Pimaricin see Natamycin**

**Pimobendan (Vetmedin) POM**

**Formulations:** Oral: 1.25 mg, 2.5 mg, 5 mg capsules.

**Action:** Inodilator producing both positive inotropic and vasodilatory effects. It is also a positive lusitrope, mediated through PDE III inhibition. It sensitizes the myocardium to calcium, producing a positive inotropic effect whilst improving myocardial oxygen economy. The compound also has phosphodiesterase III and V inhibiting effects that lead to peripheral arterio- and venodilation. It is a potent inhibitor of platelet aggregation in dogs and humans.

**Use:** Indicated for the management of congestive cardiac failure due to DCM or valvular insufficiency in the dog, particularly where there is evidence of reduced myocardial contractility. It has also been used in cats with DCM, though it is not authorized in this species. The presence of food considerably reduces bioavailability.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in hypertrophic cardiomyopathy and in cases where augmentation of cardiac output via increased contractility is not possible (e.g. aortic stenosis).

**Adverse reactions:** A moderate positive chronotropic effect and vomiting may occur in some cases, which may be avoided by dose reduction.

**Drug interactions:** The positive inotropic effects are attenuated by drugs such as beta-blockers and calcium-channel blockers. No interaction with digitalis glycosides has been noted.

**DOSES**

**Dogs, Cats:** 0.1-0.3 mg/kg p.o. q12h one hour before food.

**Small mammals, Birds, Reptiles:** No information available.
**Piperacillin** (Tazocin*) POM

**Formulations:** Injectable: 2.25 g, 4.5 g powder (2 g or 4 g piperacillin sodium + 0.25 g or 0.5 g tazobactam (Tazocin)).

**Action:** Beta-lactam antibiotics bind penicillin-binding proteins involved in cell wall synthesis, decreasing bacterial cell wall strength and rigidity, and affecting cell division, growth and septum formation. As animal cells lack a cell wall the beta-lactam antibiotics are extremely safe. The effect is bactericidal and killing occurs in a time-dependent fashion.

**Use:** Piperacillin is a ureidopenicillin, classified with ticarcillin as an antipseudomonal penicillin. It is reserved for serious life-threatening infections (e.g. endocarditis or septicaemia) caused by *Pseudomonas aeruginosa* and *Bacteroides fragilis* in neutropenic patients, although it has activity against other Gram-negative bacilli including *Proteus*. For pseudomonal septicaemias, antipseudomonal penicillins should be given with an aminoglycoside (e.g. gentamicin) as there is a synergistic effect. Piperacillin should usually be combined with a beta-lactamase inhibitor and therefore is co-formulated with tazobactam. Experience in veterinary species is limited, especially cats, and doses are largely empirical. Piperacillin inhibits the excretion of the tazobactam component in the dog.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer penicillins to hamsters, gerbils, guinea pigs, chinchillas or rabbits.

**Adverse reactions:** Nausea, diarrhoea and skin rashes are the commonest adverse effects in humans. Painful if given by i.m. injection. The sodium content of each formulation may be clinically important for patients on restricted sodium intakes.

**Drug interactions:** Piperacillin enhances the effects of non-depolarizing muscle relaxants. Gentamicin inactivates piperacillin if mixed in the same syringe. Clinical experience with this drug is limited. There is synergism between the beta-lactams and the aminoglycosides.

**DOSES**

**Dogs:** 25-50 mg/kg by slow i.v. injection/infusion q8h.

**Cats:** No information available.

**Small mammals:** Rabbits, Chinchillas, Guinea pigs, Hamsters, Gerbils: Do not use.

**Birds:** 100 mg/kg i.m/i.v. q12h.

**Reptiles:** 50-100 mg/kg i.m. q24h for 7-14 days; may be nebulized diluted 100 mg piperacillin/10 ml saline for 15-20 min q8-12h for chelonians and lizards with lower respiratory tract infections.
Piperazine (Biozine, Endorid, Piperazine) AVM-GSL

**Formulations:** Oral: 416 mg, 450 mg, 500 mg tablets.

**Action:** An anti-ascaridial anthelmintic that blocks acetylcholine, thus affecting neurotransmission and paralysing the adult worm; it has no larvicidal activity.

**Use:** Active against *Toxocara cati, T. canis, Toxascaris leonina* and *Uncinaria stenocephala*. Ineffective against tapeworms and lung worms. High doses are required to treat hookworm infection. Puppies and kittens may be wormed from 6-8 weeks of age and should be weighed accurately to prevent overdosing. Fasting is not necessary. Piperazine may be used in pregnant animals.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Uncommon but occasionally vomiting or muscle tremors and ataxia have been reported.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:**
- Ascarids: 100 mg/kg p.o. Repeat dose in 2-3 weeks.
- Hookworm: 200 mg/kg p.o. Repeat dose in 2-3 weeks.

**Small mammals:** Chinchillas: 100 mg/kg p.o. q24h for two doses. In-water medication (7 days on, 7 days off, 7 days on) at the following doses, is also possible: Guinea pigs, Hamsters: 10 mg/ml; Rats, Mice: 4-5 mg/ml.

**Birds:** Pigeons: 1.9 g/l water; Passerines: 3.7 g/l water for 12h. Rpt in 2-3 weeks.

**Reptiles:** No information available.

Piroxicam (Feldene*, Brexidol*, Piroxicam*) POM

**Formulations:** Oral: 10 mg, 20 mg capsules, 20 mg dissolving tablet. Injectable: 20 mg/ml solution.

**Action:** Inhibition of COX enzymes limits the production of prostaglandins involved in inflammation. The mechanism by which NSAIDs protect against and limit the growth of tumours is still to be determined.

**Use:** In veterinary medicine, piroxicam has been used to treat certain tumours expressing COX receptors, e.g. transitional cell carcinoma of the bladder, prostatic carcinoma and colonic-rectal carcinoma. Other NSAIDs are authorized for veterinary use in various inflammatory conditions but there is no information on the effect of these drugs in neoplastic conditions.

**Safety and handling:** Normal precautions should be observed.
Contraindications: Gastric ulceration, renal disease, concurrent use of corticosteroids.

Adverse reactions: As a non-specific COX inhibitor it may cause general adverse effects associated with NSAIDs, including GI toxicity, gastric ulceration and renal papillary necrosis (particularly if patient is dehydrated).

Drug interactions: Do not use with corticosteroids or other NSAIDs (increased risk of gastric ulceration). Concurrent use with diuretics or aminoglycosides may increase risk of nephrotoxicity.

DOSES
Dogs: 0.3 mg/kg q24h p.o.
Cats, Small mammals, Birds, Reptiles: No information available.

**PMSG** see Serum gonadotrophin

**Polymyxin B** (Surolan, Polyfax) POM-V, POM

Formulations: Topical: Surolan 5,500 IU polymyxin/ml suspension combined with miconazole and prednisolone for dermatological and otic use. Polyfax: 10,000 IU polymyxin/g ointment combined with bacitracin for dermatological and ophthalmic use.

Action: Rapidly bactericidal (concentration-dependent mechanism) by disrupting the outer membrane of Gram-negative bacteria through its action as a cationic surface acting agent.

Use: Effective against Gram-negative organisms; Gram-positives usually resistant. Particularly effective in the treatment of external pseudomonal infections, e.g. keratoconjunctivitis, otitis externa. Polymyxins are too toxic for systemic use and because of their strongly basic nature are not absorbed from the GI tract.

Safety and handling: Normal precautions should be observed.

Contraindications: Polymyxin B is potentially ototoxic so do not use if the tympanic membrane is ruptured.

Adverse reactions: Should not be used systemically as is nephrotoxic. Potentially ototoxic.

Drug interactions: Acts synergistically with a number of other antibacterial agents as it disrupts the outer and cytoplasmic membranes, thus improving penetration of other agents into bacterial cells. Cationic detergents (e.g. chlorhexidine) and chelating agents (e.g. EDTA) potentiate the antibacterial effects of polymyxin B against *Pseudomonas aeruginosa*.

DOSES
Dogs, Cats: Skin: Apply a few drops and rub in well q12h. Otic: Clean ear and apply a few drops into affected ear q12h. Ophthalmic: Apply ointment q6-8h.
Small mammals, Birds, Reptiles: No information available.
Polysulphated glycosaminoglycan (Adequan) POM-V

Formulations: Injectable: 100 mg/ml solution for i.m. injection; 250 mg/ml for intra-articular injection.

Action: Precursor to mucopolysaccharides, enzyme inhibitor, stimulates chondrocytes and synovial cells. Binds to damaged cartilage matrix consisting of aggregated proteoglycans and stimulates the synthesis of new glycosaminoglycan molecules and inhibits proteolytic enzymes.

Use: Acts as a chondroprotective agent in the adjunctive management of non-infectious and non-immune-mediated arthritides. For intra-articular use surgical preparation of the joint is necessary and for both preparations aseptic technique is mandatory. Not a replacement, but rather an adjunct for other therapies.

Safety and handling: Normal precautions should be observed.

Contraindications: Not for use in patients where arthrotomy is anticipated because of a possible increase in bleeding. Not for use when infection is present or suspected.

Adverse reactions: Intra-articular injection may cause pain and inflammation. Although rare, joint sepsis is possible.

Drug interactions: None described to date.

Doses

Dogs: 0.5 to 1.0 ml per joint q7d for 5 weeks. For i.m. therapy the manufacturer recommends 500 mg by deep i.m. injection q4d for 7 treatments. Other reported protocols are: 3-5 mg/kg i.m. q3-5d for 3 weeks or 5 mg/kg i.m. twice weekly.

Cats: 1-5 mg/kg i.m. q4d for six treatments, then as needed.

Small mammals: Rabbits: 2.2 mg/kg s.c. or i.m. q4d for six treatments, then as needed.

Birds, Reptiles: No information available.

Polyvinyl alcohol (Liquifilm Tears*, Sno Tears*) P

Formulations: Ophthalmic: 1.4%

Action: Polyvinyl alcohol is a synthetic resin tear substitute (lacromimetic).

Use: It is used for lubrication of dry eyes. In cases of keratoconjunctivitis (KCS or dry eye) it will improve ocular surface lubrication, tear retention and patient comfort while lacrostimulation therapy (e.g. topical ciclosporin) is initiated. It is more adherent and less viscous than hypromellose. Patient compliance is poor if administered >q4h; consider using a longer acting tear replacement.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: No information available.
Drug interactions: No information available.

DOSES

*Dogs, Cats, Small mammals*: 1 drop per eye q1h.

*Birds, Reptiles*: No information available.

**Potassium bromide** (Epilease, Potassium bromide solution)

**Formulations**: Oral: 100 mg, 250 mg, 1000 mg capsules; 250 mg/ml solution.

**Action**: Bromide ions suppress neuronal excitability, probably by replacing intracellular chloride and hyperpolarizing nerve cell membranes.

**Use**: Potassium bromide (KBr) is indicated for the control of seizures in dogs in which the seizures are refractory to treatment with phenobarbital or where the use of phenobarbital is contraindicated. KBr is usually used in conjunction with phenobarbital. The slow rise of plasma bromide levels after enteral administration limits its usefulness in status epilepticus. Bromide is well absorbed from the GI tract and eliminated slowly by the kidney in competition with chloride. High levels of dietary salt increase renal elimination of bromide. Consequently, it is important that the diet be kept constant once bromide therapy has started.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Do not use in the cat due to the development of severe coughing due to eosinophilic bronchitis, which may be fatal. Avoid use in dogs with a history of, or a predisposition for the development of, pancreatitis.

**Adverse reactions**: Ataxia, sedation and somnolence are seen with overdosage and loading doses. Skin reactions have been reported in animals with pre-existing skin diseases, e.g. flea bite dermatitis. Vomiting may occur after oral administration, particularly if high concentrations (>250 mg/ml) are used. Polyphagia, polydipsia and pancreatitis have also been reported. In the case of acute bromide toxicity, 0.9% NaCl i.v. is the treatment of choice.

**Drug interactions**: No information available.

**DOSES**

*Dogs*: The initial daily maintenance dose is 20-40 mg/kg p.o q24h. It is not necessary to dose more frequently. Bromide has a long half-life (>20 days) and steady state plasma concentrations may not be achieved for 3-4 months. Monitoring of serum drug concentrations should be performed and dose levels adjusted accordingly. The serum potassium bromide concentration should reach 1.0 to 2.0 mg/ml to be therapeutic.

Loading dose: In some cases, the dog may need to be started on a loading dose to raise levels in the blood rapidly to therapeutic levels. The loading dose is 200 mg/kg p.o. q24h for 5 days, after which the
dose is decreased to the maintenance dose (20-40 mg/kg p.o. q24h). If seizures resolve sooner, it is advisable to decrease to the maintenance level earlier. A single loading dose of 600-1000 mg/kg p.o. can be given but this is likely to result in excessive sedation, ataxia and potentially vomiting. The loading dose can be administered via enema, but this may result in haemorrhagic diarrhoea. Serum samples should be taken after the end of loading to check the serum concentration.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

**Potassium chloride** see Potassium salts

**Potassium citrate** (Potassium citrate BP*, Cystopurin*)

AVM-GSL

**Formulations:** Oral: 30% solution. Various preparations are available.

**Action:** Enhances renal tubular resorption of calcium, and alkalizes urine.

**Use:** Management of calcium oxalate and urate urolithiasis, and fungal urinary tract infections. May be used to treat hypokalaemia, although potassium chloride or gluconate is preferred.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Renal impairment or cardiac disease.

**Adverse reactions:** No information available

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 75 mg/kg or 2 mmol/kg p.o. q12h.

**Small mammals:** Rabbits: 33 mg/kg p.o q8h; Guinea pigs 10-30 mg/kg p.o. q12h.

**Birds, Reptiles:** No information available.

**Potassium gluconate** see Potassium salts

**Potassium phosphate** see Phosphate

**Potassium salts** (Potassium chloride, Potassium gluconate) (Kaminox, Tumil-K) POM, AGM-GSL

**Formulations:** Injectable: 15% KCl solution (150 mg KCl/ml; 2 mmol/ml K⁺ and Cl⁻). Dilute with at least 25 times its own volume before i.v. administration. Oral: Tablets containing 2 mEq potassium gluconate; Powder (2 mEq per 1/4 teaspoon) (Tumil-K); Liquid 1 mEq/ml potassium gluconate formulated with a range of amino acids, B vitamins and iron (Kaminox). Note: 1 mmol/l =1 mEq/l.
**Action:** Replacement of potassium.

**Use:** Treatment or prevention of known hypokalaemic states; prolonged anorexia and chronic renal failure are the most common, but can also use with diuretics that are not potassium sparing. If rapid correction is not necessary, may be added to s.c. fluids but do not exceed 30 mEq/l as higher levels are irritating. Because potassium is primarily an intracellular electrolyte, serum concentrations may not immediately reflect clinical effect. Concentrated solutions must be diluted before i.v. use.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Hyperkalaemia, acute or obstructive renal failure, untreated Addison’s disease, acute dehydration and diseases with impaired or obstructed GI motility. Use with caution in any renal failure patient as 80-90% of excretion is renal. Use with caution in digitalized patients. Do not give rapid i.v. injections.

**Adverse reactions:** Primarily development of hyperkalaemia when administered too rapidly or to patients with impaired renal function. Clinical signs range from muscle weakness to GI disturbances to cardiac arrhythmias and cardiac arrest.

**Drug interactions:** Potassium retention leading to severe hyperkalaemia may develop when used with angiotensin converting enzyme inhibitors (e.g. captopril, enalapril) or potassium-sparing diuretics (e.g. spironolactone). Potassium chloride is not compatible with many drugs especially those in sodium salt form.

**DOSES**

**Dogs:** Intravenous: Doses must be titrated for each patient; dilute concentrated solutions prior to use.

<table>
<thead>
<tr>

</tbody>
</table>

Rate of i.v. infusion should not exceed 0.5 mmol/kg/h, especially when concentration in replacement fluid is >60 mmol/l. Use of fluid pumps is recommended. Oral: Replacement dose needs to be titrated to effect to maintain mid-range normal values in each individual patient. Starting doses are 2 mEq per 4.5 kg in food q12h or 2.2 mEq per 100 kcal required energy intake.

**Cats:** Intravenous: Doses as for dogs. Oral: Replacement dose needs to be titrated to effect to maintain mid-range normal values in each individual patient. Starting doses are 2.2 mEq per 4.5 kg in food q12h or 2-6 mEq/cat/day p.o. in divided doses q8-12h.

**Small mammals, Birds, Reptiles:** No information available.
Potentiated sulphonamides see Trimethoprim/Sulphonamide

Pralidoxime (Pralidoxime*) POM

Formulations: 200 mg/ml solution.

Action: Reactivates the cholinesterase enzyme damaged by organophosphate (OP) and allows the destruction of accumulated acetylcholine at the synapse to be resumed. In addition, pralidoxime detoxifies certain OPs by direct chemical inactivation and retards the ‘ageing’ of phosphorylated cholinesterase to a non-reactive form.

Use: Management of OP toxicity. Only effective if given within 24 hours of poisoning. Pralidoxime does not appreciably enter the CNS, thus CNS toxicity is not reversed. If given within 24 hours of exposure, treatment is usually only required for 24–36 hours. Respiratory support may be necessary. Treatment of OP toxicity should also include atropine.

Contraindications: Pralidoxime is ineffective and contraindicated for poisoning due to carbamate or OP compounds without anticholinesterase activity

Adverse reactions: Nausea, tachycardia, hyperventilation, and muscular weakness are reported in humans.

Drug interactions: Aminophylline, morphine, phenothiazines or theophylline should be avoided in these patients.

DOSES

Dogs: Dilute to a 20 mg/ml solution and administer 20–50 mg/kg slowly i.v. (over 2 minutes at least – 500 mg/min max.) i.m., s.c. Repeat doses prn.

Cats: Dilute to a 20 mg/ml solution and administer 20–50 mg/kg slowly i.v. (over 2 minutes at least – 500 mg/min max.) i.m., s.c. Repeat doses prn.

Small mammals, reptiles: No information available

Birds: 10–100 mg/kg i.m., i.v. q24h prn.

Praziquantel (Dolpac, Droncit, Drontal plus, Drontal cat tablets, Milbemax) POM-V, NFA-VPS, VPM-AVM, GSL

Formulations: Injectable: 56.8 mg/ml solution. Oral: 50 mg tablets: 50 mg praziquantel + 144 mg pyrantel + 150 mg febantel (Drontal plus); 20 mg praziquantel + 230 mg pyrantel (Drontal cat). Topical: 20 mg in spot-on pipette. See Pyrantel for details on Dolpac.

Action: Cestocide that increases cell membrane permeability of susceptible worms, resulting in loss of intracellular calcium and paralysis. This allows the parasites to be phagocytosed or digested.
Use: Treatment of *Dipylidium caninum*, *Taenia* spp., *Echinococcus granulosus* and *Mesocestoides* in dogs and cats. Because it kills all intestinal forms of *Echinococcus*, it is the preferred drug in most *Echinococcus* control programmes. The PETS travel scheme requires animals to be treated with praziquantel prior to entry into the UK. The inclusion of pyrantel and febantel in some preparations increases the spectrum of efficacy. Drontal plus can be used from 2 weeks of age. Drontal cat tablets can be used from 6 weeks of age. Retreatment is usually unnecessary unless reinfection takes place.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in unweaned puppies or kittens, as they are unlikely to be affected by tapeworms. Do not use the spot-on preparation in animals <1 kg. Avoid the i.m. route in reptiles.

**Adverse reactions:** The injection may cause localized tissue sensitivity, particularly in cats. Injections in reptiles may cause bruising and tissue necrosis at the site.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 3.5-7.5 mg/kg i.m., s.c.; 5 mg/kg p.o. (Drontal plus: 1 tablet/10 kg); 8 mg/kg spot-on.

**Cats:** 3.5-7.5 mg/kg i.m., s.c.; 5 mg/kg p.o. (Drontal cat tablets: 1 tablet/4 kg); 8 mg/kg spot-on.

**Small mammals:** Ferrets: 5-10 mg/kg p.o repeated in 10-14d; Rabbits: 5-10 mg/kg p.o., s.c. repeated in 10 days; Gerbils, Rats, Mice: 30 mg/kg p.o. q14d (x 3 treatments).

**Birds:** Pigeons: 10-20 mg/kg p.o. or 7.5 mg/kg s.c.; Other birds: 10 mg/kg i.m., repeat after 7-10d.

**Reptiles:** 5-8 mg/kg p.o., repeat after 2 weeks in most species.

**Prazosin** (Prazosin*, Hypovase*) POM

**Formulations:** Oral: 0.5 mg, 1 mg, 2 mg, 5 mg tablets.

**Action:** Prazosin is a post-synaptic alpha-1 blocking agent causing arterial and venous vasodilation. This leads to reduction in blood pressure and systemic vascular resistance.

**Use:** Management of congestive heart failure, through increasing cardiac output. May be useful in promoting urine flow in patients with benign prostatic hyperplasia (relaxes smooth muscle) and in the management of hypertension associated with cardiac or renal disease. Efficacy may decline over time. Not often used.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Hypotension, renal failure.

**Adverse reactions:** Hypotension, drowsiness, weakness, GI upsets.

**Drug interactions:** Concomitant use of beta-blockers (e.g. propranolol) or diuretics (e.g. furosemide) may increase the risk of a
first dose hypotensive effect. Calcium-channel blockers may cause additive hypotension. Prazosin is highly protein-bound and so may be displaced by, or displace, other highly protein-bound drugs (e.g. warfarin, sulphonamide) from plasma proteins.

**DOSES**

**Dogs:** 1 mg p.o. q8-12h (dogs up to 15 kg); 2 mg p.o. q8-12h (>15 kg). Monitor efficacy by measuring blood pressure.

**Cats:** 0.25-1 mg p.o. q8-12h.

**Small mammals, Birds, Reptiles:** No information available.

**Prednisolone** (PLT, Pred forte*, Prednicare, Prednidale, Prednisolone) POM-V

**Formulations:** Ophthalmic: Prednisolone acetate 0.5%, 1% suspensions (Pred forte). Topical: Prednisolone is a component of many topical dermatological, otic and ophthalmic preparations. Injectable: Prednisolone sodium succinate 10 mg/ml solution; 7.5 mg/ml suspension plus 2.5 mg/ml dexamethasone. Oral: 1 mg, 5 mg, 25 mg tablets. PLT is a compound preparation containing cinchophen.

**Action:** Binds to specific cytoplasmic receptors which then enter the nucleus and alter the transcription of DNA, leading to alterations in cellular metabolism which result in anti-inflammatory, immunosuppressive and antifibrotic effects. Also has glucocorticoid activity and acts in dogs as an ADH antagonist.

**Use:** Management of chronic allergic/inflammatory conditions (e.g. atopy, inflammatory bowel disease), immune-mediated conditions, hypoadrenocorticism, and lymphoproliferative and other neoplasms. In combination with cinchophen (PLT) it is used in the management of osteoarthritis. Prednisolone has approximately 4 times the anti-inflammatory potency and half the relative mineralocorticoid potency of hydrocortisone. It, like methylprednisolone, is considered to have an intermediate duration of activity and is suitable for alternate-day use. Animals on chronic therapy should be tapered off their steroids when discontinuing the drug. There are no studies comparing protocols for tapering immunosuppressive or anti-inflammatory therapy; it is appropriate to adjust the therapy according to laboratory or clinical parameters. For example, cases with immune-mediated haemolytic anaemia should have their therapy adjusted following monitoring of their haemocrit. There is no evidence that long-term low doses of glucocorticoids do, or do not, prevent relapse of immune-mediated conditions. If using in birds must make sure bird is genuinely pruritic and underlying infectious disease, e.g. aspergillosis, chlamydophilosis, has been excluded before use.

**Safety and handling:** Shake suspension before use.

**Contraindications:** Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus. Impaired wound healing and delayed recovery from infections may be seen. Topical corticosteroids are
contraindicated in ulcerative keratitis. Use glucocorticoids with care in rabbits as they are a corticosteroid-sensitive species and even small single doses can cause severe pathological changes.

**Adverse reactions:** Prolonged use of glucocorticoids suppresses the hypothalamic-pituitary axis (HPA), causing adrenal atrophy, and may cause significant proteinuria and glomerular changes in the dog. Catabolic effects of glucocorticoids leads to weight loss and cutaneous atrophy. Iatrogenic hyperadrenocorticism may develop with chronic use. Vomiting, diarrhoea and GI ulceration may develop; the latter may be more severe when corticosteroids are used in animals with neurological injury. Hyperglycaemia and decreased serum T4 values may be seen in patients receiving prednisolone. Corticosteroids should be used with care in birds as there is a high risk of immunosuppression and side effects, such as hepatopathy and a diabetes mellitus-like syndrome.

**Drug interactions:** There is an increased risk of GI ulceration if used concurrently with NSAIDs. Hypokalaemia may develop if acetazolamide, amphotericin B or potassium-depleting diuretics (e.g. furosemide, thiazides) are administered concomitantly with corticosteroids. Glucocorticoids may antagonize the effect of insulin. The metabolism of corticosteroids may be enhanced by phenytoin or phenobarbital.

**DOSES**

**Dogs:**
- Ophthalmic: Dosage frequency and duration of therapy is dependent upon type of lesion and response to therapy. Usually 1 drop in affected eye(s) q4-24h tapering in response to therapy.
- Allergy: 0.5-1 mg/kg p.o. q12h initially, tapering to lowest q48h dose.
- Anti-inflammatory: 0.5-1 mg/kg p.o. q12h; taper to 0.5-1 mg/kg q48h.
- Immunosuppression: 1.1-3.3 mg/kg p.o. q12h, tapering to 0.5-2.2 mg/kg q48h.
- Hypoadrenocorticism: 0.2-0.3 mg/kg with fludrocortisone. The use of prednisolone may be discontinued in most cases once the animal is stable.
- Lymphoma: see Appendix.

**Cats:**
- Ophthalmic: Doses as for dogs.
- Allergy: Doses as for dogs.
- Anti-inflammatory: 1.1 mg/kg p.o. q12h; taper to 1.1-2.2 mg/kg q48h.
- Immunosuppression: 2.2-6.6 mg/kg p.o. q12h, tapering to 2.2-4.4 mg/kg q48h.
- Hypoadrenocorticism: Doses as for dogs.
- Lymphoma: see Appendix.
Small mammals: Ferrets: lymphoma, anti-inflammatory: 1-2 mg/kg p.o. q24h (see specific protocols for lymphoma); postoperative management of adrenalectomy: 0.25-0.5mg/kg p.o. q12h, taper to q48h; Rabbits: anti-inflammatory: 0.25-0.5 mg/kg p.o. q12h for 3 days, then q24h for 3 days, then q48h; Others: anti-inflammatory: 1.25-2.5 mg/kg p.o. q24h.

Birds: Pruritus: 1 mg/kg p.o. q12h, reduced to minimum effective dose as quickly as possible.

Reptiles: analgesic, anti-inflammatory: 2-5 mg/kg p.o. q 24-48h; lymphoma: 40 mg/m² q48h with chlorambucil 2 mg/m² q24h q30d.

Primidone (Mysoline Veterinary Tablets) POM-V

Formulations: Oral: 250 mg tablets.

Action: Raises electrically induced seizure thresholds and alters seizure patterns. The exact mechanism of seizure prevention is unknown but is thought to involve facilitating inhibitory GABA receptors. Primidone is rapidly metabolized to the active metabolites phenobarbital and phenylethylmalonamide (PEMA). In dogs approximately 85% of anti-seizure activity is thought to be due to phenobarbital, with some potentiation by PEMA.

Use: Treatment of epilepsy in dogs. Efficacy of primidone in patients refractory to phenobarbital may be the result of improved conversion following induction of hepatic microsomal enzymes or related to the PEMA metabolite. The side effects of primidone may be more severe than those for phenobarbital.

Safety and handling: Normal precautions should be observed.

Contraindications: Avoid in hepatic or renal impairment. Do not use in cats.

Adverse reactions: PU/PD, polyphagia, personality changes, sedation and ataxia. The latter two are often seen early in therapy and may subside with time. They may indicate the development of toxic serum levels. Chronic therapy induces progressive hepatic injury; liver enzymes should be monitored every 6 months. As neutropenia, thrombocytopenia, anaemia and splenomegaly have been reported to develop in dogs receiving phenobarbital, there is the potential for such adverse effects to develop in dogs receiving primidone. Dose reduction or monitoring of serum levels is indicated if any adverse effects are present. Therapeutic barbiturate serum levels vary with different laboratories, but are in the region of 65-172 µmol/l. When withdrawing primidone reduce the dose gradually. If switching from primidone to phenobarbital, 3.8 mg primidone is equivalent to 1 mg of phenobarbital.

Drug interactions: Therapy with barbiturates may reduce the serum concentration or the effect of a number of other drugs, in particular drugs that undergo hepatic metabolism. Drugs with a reduced serum concentration or clinical effect if used in conjunction with barbiturates include anticoagulants, beta-blockers undergoing hepatic metabolism.
(those undergoing urinary excretion are not affected), corticosteroids, lamotrigine, levetiracetam (although most likely not to clinically significant levels), lidocaine (i.v.), metronidazole, opioids (including methadone), paracetamol, tetracycline, theophylline, thyroid hormones and zonisamide. Drugs resulting in a drop in the serum concentration of mysoline include acetazolamide and vitamin B compounds (by reducing the conversion of mysoline to phenobarbital). Felbamate may result in an increase in phenobarbital levels and subsequent phenobarbital toxicity. Concurrent use of two or more CNS suppressants may have additive effects and should be avoided or done with caution.

**DOSES**

**Dogs:** 5-28 mg/kg p.o. q12h. Start at the lower dose if adding primidone to a treatment regimen using phenobarbital. Monitor for signs of phenobarbital toxicity and/or serum phenobarbital levels.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.

---

**Procainamide (Pronestyl®) POM**

**Formulations:** Injectable: 100 mg/ml.

**Action:** Decreases the excitability of the myocardium. Electrical conduction is slowed through the bundle of His, atrium and ventricle. The refractory period is prolonged in both atria and ventricles.

**Use:** Management of symptomatic ventricular premature complexes and ventricular tachycardia. May have effects on some supraventricular arrhythmias. Chiefly used for acute termination of ventricular tachycardia in dogs. Not first choice drug for supraventricular arrhythmias. At therapeutic doses cardiac output is usually unaffected unless there is pre-existing myocardial damage, whilst slight vagolytic effects, associated with mild increases in heart rate, may be seen.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Myasthenia gravis, SLE, 2nd or 3rd degree heart block. Caution is advised in patients with significant hepatic or renal disease or with congestive heart failure.

**Adverse reactions:** Weakness, GI upsets, hepatotoxicity, hypotension, myocardial depression. Higher doses lead to the development of AV block and ventricular extrasystoles.

**Drug interactions:** Increased myocardial depression may develop if procainamide is used concurrently with other anti-arrhythmic agents. The effects of pyridostigmine (or other anticholinesterases) may be antagonized by procainamide. The effects of other hypotensive drugs may be potentiated by procainamide. Its use in patients with digoxin intoxication should be reserved for those where treatment with potassium, lidocaine or phenytoin has been ineffective. Cimetidine
inhibits the metabolism of procainamide and decreases the renal clearance of procainamide and NALA (active metabolite), thereby increasing serum levels. The neuromuscular blocking activity of muscle relaxants such as suxamethonium may be potentiated or prolonged by procainamide.

**DOSES**

**Dogs:** Initially 6-8 mg/kg i.v. over 5 min or 6-20 mg/kg i.v. as 2 mg/kg/min boluses, then a constant rate infusion of 0.025-0.05 mg/kg/min. Do not exceed 0.03 mg/kg/min rate for longer than 3 hours. Dilute in normal saline when giving i.v. Thereafter, 6-20 mg/kg i.m. q4-6h.

**Cats:** 3-8 mg/kg i.m. q6-8h or 1-2 mg/kg slowly i.v. or 0.01-0.02 mg/kg/min constant rate i.v. infusion.

**Small mammals, Birds, Reptiles:** No information available.

---

**Prochlorperazine** (Buccastem*, Prochlorperazine*, Stemetil*)

**POM**

**Formulations:** Injectable: 12.5 mg/ml solution in 1 ml ampoule. Oral: 3 mg, 5 mg tablets, 5 mg/ml syrup.

**Action:** Blocks dopamine, muscarinic acetylcholine and 5-HT3 receptors in chemoreceptor trigger zone and vomiting centre.

**Use:** Predominantly to control motion sickness and emesis associated with vestibular disease. Maropitant is authorized as an anti-emetic in dogs and so in this species prochloperazine is not a first choice drug.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Sedation, depression, hypotension and extrapyramidal reactions (rigidity, tremors, weakness, restlessness, etc.).

**Drug interactions:** CNS depressant agents (e.g. anaesthetics, narcotic analgesics) may cause additive CNS depression if used with prochlorperazine. Antacids or anti diarrhoeal preparations (e.g. bismuth subsalicylate or kaolin/pectin mixtures) may reduce GI absorption of oral phenothiazines.

Increased blood levels of both drugs may result if propranolol is administered with phenothiazines. Phenothiazines block alpha-adrenergic receptors, which may lead to unopposed beta activity causing vasodilation and increased cardiac rate if adrenaline is given.

**DOSES**

**Dogs, Cats:** 0.1-0.5 mg/kg i.v., i.m., s.c. q6-8h; 0.5-1 mg/kg p.o. q8-12h.

**Small mammals, Birds, Reptiles:** No information available.
**Progesterone** (Progesterone*) POM

**Formulations:** Injectable: 25 mg/ml oily solution.

**Action:** Binds to specific cytoplasmic receptors, which then enter the nucleus and alter the transcription of DNA leading to alterations in cellular metabolism.

**Use:** Threatened or habitual abortion, induction of parturition and postponement of oestrus. Doses of 2 mg/kg i.m. q48h will maintain plasma progesterone values >2 ng/ml, the level required to maintain pregnancy. Parturition can be expected 72 hours after the last injection. Parturition should be planned for day 57 after the onset of cytological dioestrus in the bitch or 64 days after mating in the queen.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in animals with diabetes mellitus. Prolonged therapy may result in pathological uterine changes in bitches.

**Adverse reactions:** Reversible masculinization of the external genitalia may occur in female puppies born to bitches treated during pregnancy.

**Drug interactions:** No information available.

**DOSES**

- **Dogs:** 1-3 mg/kg i.m., s.c.
- **Cats:** 0.2-2 mg/kg i.m., s.c.
- **Small mammals, Birds, Reptiles:** No information available.

**Proligestone** (Delvosteron) POM-V

**Formulations:** Injectable: 100 mg/ml suspension.

**Action:** Alters the transcription of DNA, leading to alterations in cellular metabolism which mimic those caused by progesterone.

**Use:** Postponement of oestrus in the bitch, queen and jill ferret, treatment and prevention of false pregnancy in the bitch and rabbit, and control of miliary dermatitis in the cat. It has also been used in the treatment of pituitary dwarfism in the dog. Miliary dermatitis can also be treated with glucocorticoids which may have fewer side effects. As coat colour changes may occasionally occur, injection into the medial side of the flank fold is recommended for thin-skinned or show animals.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Best avoided in diabetic animals, as insulin requirements are likely to change unpredictably. Do not give to bitches before or at first oestrus.

**Adverse reactions:** Proligestone does not appear to be associated with as many or as serious adverse effects as other progestogens (e.g. megestrol acetate, medroxyprogesterone acetate). However, adverse effects associated with long-term progestogen use, e.g.
temperament changes (listlessness and depression), increased thirst or appetite, cystic endometrial hyperplasia/pyometra, diabetes mellitus, acromegaly, adrenocortical suppression, mammary enlargement/neoplasia and lactation, may be expected. Irritation at site of injection may occur and calcinosis circumscripta at the injection site has been reported.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 10-33 mg/kg depending on body weight:

<table>
<thead>
<tr>
<th>Body weight (kg)</th>
<th>Dose (mg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;5</td>
<td>100-150</td>
</tr>
<tr>

<td>350-450</td>
</tr>
<tr>
<td>30-45</td>
<td>450-550</td>
</tr>
<tr>
<td>45-60</td>
<td>550-600</td>
</tr>
<tr>
<td>thereafter</td>
<td>10 mg/kg</td>
</tr>
</tbody>
</table>

This dose should be given once for the suppression of oestrus and prevention/treatment of false pregnancy. If permanent postponement of oestrus is required, dose is given during pro-oestrus, a second dose 3 months later, a third dose 4 months after the second, and subsequent doses given every 5 months thereafter. Once dosing ceases bitches may come into oestrus, on average 6-7 months later. Doses for treatment of acromegaly are as above, given monthly by injection until signs of hair growth are evident.

**Cats:**
- Oestrus postponement: 100 mg/cat s.c.
- Miliary dermatitis: 33-50 mg/kg s.c. repeated once after 14 days if the response is inadequate.

**Small mammals:** Ferrets: 50 mg/ferret s.c. once; Rabbits: 30 mg/kg for pseudopregnancy.

**Birds, Reptiles:** No information available.

**Promethazine** (Phenergan*) POM

**Formulations:** Oral: 10 mg, 25 mg tablets, 1 mg/ml syrup. Injectable: 25 mg/ml solution.

**Action:** Binds to H1 histamine receptors and prevents histamine from binding.

**Use:** Management of allergic disease and early treatment of anaphylaxis. Specific doses for dogs and cats have not been determined by pharmokinetic studies.
Safety and handling: Normal precautions should be observed.

Contraindications: Use with caution in cases with urinary retention, angle-closure glaucoma and pyloroduodenal obstruction. May reduce seizure threshold.

Adverse reactions: May cause mild sedation

Drug interactions: No information available.

DOSES

Dogs, Cats: 0.2-0.4 mg/kg i.v., i.m. q6-8h, 12.5-25 mg/dog p.o. q24h.

Small mammals, Birds, Reptiles: No information available.

Propantheline (Pro-Banthine*) POM

Formulations: Oral: 15 mg tablet.

Action: Quartenary antimuscarinic agent.

Use: Treatment of incontinence caused by detrusor hyper-reflexia, as a peripherally acting anti-emetic and as an adjunctive therapy to treat GI disorders associated with smooth muscle spasm.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Antimuscarinics may cause constipation and paralytic ileus with resultant bacterial overgrowth. Other adverse effects include sinus tachycardia, ectopic complexes, mydriasis, photophobia, cycloplegia, increased intraocular pressure, vomiting, abdominal distension, urinary retention and drying of bronchial secretions.

Drug interactions: Antihistamines and phenothiazines may enhance the activity of propantheline and its derivatives. Chronic corticosteroid use (may increase intraocular pressure) and primidone may potentiate the adverse effects of propantheline and its derivatives. Propantheline and its derivatives may enhance the actions of sympathomimetics and thiazide diuretics. Propantheline and its derivatives may antagonize the actions of metoclopramide.

DOSES

Dogs:
• Incontinence: 0.4 mg/kg p.o. q6-8h.
• GI indications: 0.25 mg/kg p.o. q8-12h (round dose to nearest 3.75 mg).

Cats:
• Incontinence: 7.5 mg/cat p.o. q3d.
• GI indications: Doses as for dogs.

Small mammals, Birds, Reptiles: No information available.
Proparacaine see Proxymetacaine

Propentofylline (Vivotin) POM-V

Formulations: Oral: 50 mg, 100 mg tablets.

Action: Propentofylline is a xanthine derivative that increases blood flow to the heart, muscle and CNS via inhibition of phosphodiesterase. It also has an anti-arrhythmic action, bronchodilator effects, positive inotropic and chronotropic effects on the heart, inhibitory effects on platelet aggregation and reduces peripheral vascular resistance.

Use: Relief of bronchospasm. Improvement of demeanour in animals. Treatment of age-related behaviour problems, in particular in combination with selegiline and dietary management for canine cognitive dysfunction.

Safety and handling: Normal precautions should be observed.

Contraindications: May increase myocardial oxygen demand and should be used with care in cardiac disease. Do not administer to pregnant bitches or breeding animals, as it has not yet been evaluated in this class of animal.

Adverse reactions: No information available

Drug interactions: No information available.

DOSES

**Dogs:** 2.5-5 mg/kg p.o. q12h. Administer 30 min prior to food.

**Birds:** 5 mg/kg p.o. q12h.

**Cats, Small mammals, Reptiles:** No information available.

Propofol (Rapinovet, PropoFol, Procare, TIVAfol) POM-V

Formulations: Injectable: 10 mg/ml solution.

Action: The mechanism of action is not fully understood but it is thought to involve modulation of the inhibitory activity of GABA at GABA receptors.

Use: Induction of anaesthesia and maintenance of anaesthesia using intermittent boluses or a continuous rate infusion. Injection i.v. produces a rapid loss of consciousness as the CNS takes up the highly lipophilic drug. Over the next few minutes propofol distributes to peripheral tissues and the concentration in the CNS falls such that, in the absence of further doses, the patient wakes up. In dogs propofol is rapidly metabolized in the liver and other extrahepatic sites: in cats recovery is less rapid due to the phenolic nature of the compound. Propofol does not have analgesic properties, therefore it is better used in combination with other drugs to maintain anaesthesia; for example, a continuous rate infusion of a potent opioid. Propofol is not irritant to tissues but a
pain reaction is commonly evident during i.v. injection; the underlying mechanism causing pain is unknown. The concept that propofol is safer than thiopental in certain categories of high risk cases is without foundation.

**Safety and handling:** Shake the emulsion well before use and do not mix with other therapeutic agents or therapeutic fluids prior to administration. The current preparation contains no bacteriostat; opened bottles should be stored in a refrigerator and used as quickly as possible within 24 hours or discarded.

**Contraindications:** Considerable care must be taken with administration in hypovolaemic animals and those with diminished cardiopulmonary, hepatic and renal reserves.

**Adverse reactions:** The rapid injection of large doses causes apnoea, cyanosis, bradycardia and severe hypotension. Problems are less likely when injection is made over 30-60 seconds. Muscle rigidity, paradoxical muscle movements and tremors can sometimes occur in dogs immediately after i.v. administration. The muscle movements are unresponsive to management with diazepam, and further doses of propofol compound the problem. The tremors and movements wane with time without treatment. Repeated daily administration (for 5 days) has been associated with Heinz body anaemia in cats.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** Unpremedicated: 6-7 mg/kg i.v.; premedicated 1-4 mg/kg i.v. Continuous rate infusion for sedation or maintenance of anaesthesia: 0.1-0.4 mg/kg/minute. Lower doses are required when propofol is combined with other drugs for maintenance of anaesthesia.

**Cats:** Unpremedicated: 8 mg/kg i.v.; premedicated 2-5 mg/kg i.v. Continuous rate infusion for maintenance of anaesthesia is likely to result in a prolonged recovery in cats, doses of 0.1-0.4 mg/kg/minute are appropriate depending on other agents given in combination.

**Small mammals:** Ferrets: 2-8 mg/kg i.v.; Rabbits: unpremedicated 10 mg/kg i.v.; premedicated 2-6 mg/kg i.v.; Rats 7.5-10 mg/kg i.v.; Mice: 12-26 mg/kg i.v.

**Birds:** 10 mg/kg i.v. by slow infusion to effect: supplemental doses up to 3 mg/kg (see Appendix).

**Reptiles:** 5-10 mg/kg i.v., intraosseously.

**Propranolol** (Inderal*, Propranolol*) POM

**Formulations:** Injectable: 1 mg/ml solution. Oral: 10 mg, 40 mg, 80 mg, 160 mg tablets.

**Action:** Antagonizes beta-1 adrenoceptors, blocking their chronotropic and inotropic effects on the heart. By antagonizing beta-2 adrenoceptors, their vasodilatory actions are blocked.
antihypertensive effects are mediated through reducing cardiac output, altering the baroreceptor reflex sensitivity and blocking peripheral adrenoceptors.

**Use:** Management of cardiac arrhythmias (sinus tachycardia, atrial fibrillation or flutter, supraventricular tachycardia, premature ventricular depolarization), hypertrophic cardiomyopathy or obstructive heart disease. Also an effective antihypertensive drug and can be used in phaeochromocytoma if combined with an alpha blocker. Used to reverse some of the clinical features of thyrotoxicosis prior to surgery in patients with hyperthyroidism. May be used in behavioural therapy to reduce somatic signs of anxiety and is therefore useful in the management of situational anxieties and behavioural problems where contextual anxiety is a component. Some authors suggest using propranolol in combination with phenobarbital for the management of fear- and phobia-related behaviour problems. There is a significant difference between i.v. and oral doses. This is a consequence of propranolol’s lower bioavailability when administered orally as a result of decreased absorption and a high first-pass effect. Wean off slowly when using chronic therapy.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in patients with bradycardia and AV block. Relatively contraindicated in animals with congestive heart failure.

**Adverse reactions:** Bradycardia, impaired AV conduction, myocardial depression, heart failure, syncope, glucose intolerance, bronchospasm, diarrhoea and peripheral vasoconstriction. Depression and lethargy are occasionally seen as a result of CNS penetration. Propranolol may exacerbate any pre-existing renal impairment. Sudden withdrawal of propranolol may result in exacerbation of arrhythmias or the development of hypertension.

**Drug interactions:** As the beta effects of sympathomimetics (e.g. adrenaline, phenylpropanolamine, terbutaline) may be blocked by propranolol, the unopposed alpha effects may result in severe hypertension and a decreased heart rate. The hypotensive effect of propranolol is enhanced by anaesthetic agents (those that depress myocardial activity), phenothiazines, antihypertensive drugs (e.g. hydralazine, prazosin), diazepam, diuretics and other anti-arrhythmics. There is an increased risk of bradycardia, severe hypotension, heart failure and AV block if propranolol is used concurrently with calcium-channel blockers (e.g. diltiazem, verapamil). Concurrent digoxin administration potentiates bradycardia. The metabolism of propranolol is accelerated by thyroid hormones, thus reducing its effect. The dose of propranolol may need to be decreased when initiating carbimazole therapy. Oral aluminium hydroxide preparations reduce propranolol absorption. Cimetidine may decrease the metabolism of propranolol, thereby increasing its blood levels. Propranolol enhances the effects of muscle relaxants (e.g. suxamethonium, tubocurarine). Hepatic enzyme induction by phenobarbital or phenytoin may increase the rate of metabolism of propranolol. There is an increased risk of lidocaine
toxicity if administered with propranolol due to a reduction in lidocaine clearance. The bronchodilatory effects of theophylline may be blocked by propranolol. Although the use of propranolol is not contraindicated in patients with diabetes mellitus, insulin requirements should be monitored as propranolol may enhance the hypoglycaemic effect of insulin.

DOSES

Dogs:
• Cardiac indications: 0.02-0.08 mg/kg i.v. slowly over 5 min q8h; 0.25-1.5 mg/kg p.o. q8h. Usual maintenance doses 0.25-1.5 mg/kg p.o. q8h. Start at the lower doses if myocardial function is poor.
• Phaeochromocytoma: 0.15-0.5 mg/kg p.o. q8h in conjunction with an alpha blocker.
• Behavioural modification: 0.5-3.0 mg/kg p.o. as required up to q12h.

Cats:
• Cardiac indications: 0.04-0.06 mg/kg i.v. slowly (i.e. dilute 0.25 mg in 1 ml of saline and administer 0.2 ml boluses i.v. to effect); 2.5-5 mg/cat p.o. q8h.
• Behavioural modification: 0.2-1.0 mg/kg p.o. as required up to q8h.

Small mammals: Ferrets: 0.5-2 mg/kg p.o., s.c. q12-24h for hypertrophic cardiomyopathy.

Birds, Reptiles: No information available.

Prostaglandin E2 see Dinoprostone
Prostaglandin F2 see Dinoprost tromethamine

Protamine sulphate (Protamine sulphate*) POM

Formulations: Injectable: 10 mg/ml solution.

Action: An anticoagulant that, when administered in the presence of heparin, forms a stable salt, causing the loss of anticoagulant activity of both compounds.

Use: Heparin overdosage. The effects of heparin are neutralized within 5 minutes of protamine administration, with the effect persisting for approximately 2 hours.

Safety and handling: Do not store diluted solutions.

Contraindications: No information available.

Adverse reactions: Anaphylaxis, hypotension, bradycardia, nausea, vomiting, pulmonary hypertension and lassitude are seen in humans.

Drug interactions: No information available.
DOSES

**Dogs, Cats:** 1 mg of protamine inactivates 80-100 IU of heparin. Heparin disappears rapidly from the circulation. Decrease the dose of protamine by half for each 30-minute period since the heparin was administered. Give protamine i.v. very slowly over 1-3 min. Do not exceed 50 mg in any 10-minute period. Dilute protamine in 5% dextrose or normal saline.

**Small mammals, Birds, Reptiles:** No information available.

---

**Proxymetacaine (Proparacaine) (Proxymetacaine*) POM**

**Formulations:** Ophthalmic: 0.5% solution (single-use vials).

**Action:** Local anaesthetic action is dependent on reversible blockade of the Na⁺ channel, preventing propagation of an action potential along the nerve fibre. Sensory nerve fibres are blocked before motor nerve fibres, allowing a selective sensory blockade at low doses.

**Use:** Proxymetacaine is used on the ocular surface (cornea and conjunctival sac), the external auditory meatus and the nares. It acts rapidly (within 10 seconds) and provides anaesthesia for 25-55 minutes in the conjunctival sac depending on the species. Serial application increases duration and depth of anaesthesia. Topical anaesthetics block reflex tear production and should not be applied before a Schirmer tear test.

**Safety and handling:** Store in refrigerator and in the dark; reduced efficacy if stored at room temperature for >2 weeks.

**Contraindications:** Do not use for therapeutic purposes.

**Adverse reactions:** Conjunctival hyperaemia is common; local irritation manifested by chemosis may occasionally occur for several hours after administration (less likely than with tetracaine). All topical anaesthetics are toxic to the corneal epithelium and delay healing of ulcers.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** Ophthalmic: 1-2 drops/eye; maximal effect at 15-25 min, duration 45-55 min. Aural/nasal: 5-10 drops/ear or nose every 5-10 min (maximum 3 doses if used intranasally).

**Cats:** Ophthalmic: 1-2 drops/eye; duration 25 min.

**Small mammals:** Ophthalmic: 1-2 drops/eye; duration 1 h in rabbits.

**Birds, Reptiles:** No information available.

---

**Pyrantel (Dolpac, Drontal) POM-V**

**Formulations:** Oral: Drontal plus: praziquantel 20 mg + pyrantel 144 mg + febantel 150 mg tablets; Drontal puppy suspension: pyrantel 14.4 mg/ml + febantel 15 mg/ml; Drontal cat: 230 mg pyrantel + 20 mg praziquantel. Dolpac: combination of oxantel,
pyrantel and praziquantel in tablets of 40 mg + 10 mg + 10 mg (Dolpac for Small Dogs), 200 mg + 50 mg + 50 mg (Dolpac for Medium Dogs); 500 mg + 125 mg + 125 mg (Dolpac for Large Dogs).

**Action:** A cholinergic agonist which interferes with neuronal transmission in parasites and thereby kills them. Oxantel is a derivative of pyrantel with increased activity against whipworms.

**Use:** Control of *Toxocara canis*, *Toxascaris leonina*, *Trichuris vulpis*, *Uncinaria stenocephala*, *Ancylostoma caninum* and *A. braziliensis*.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in puppies <2 months or <1 kg. Safety has not been established in pregnant or lactating animals and therefore its use is not recommended.

**Adverse reactions:** Vomiting and diarrhoea may be observed.

**Drug interactions:** The addition of febantel has a synergistic effect. Do not use with levamisole, piperazine or cholinesterase inhibitors.

**DOSES**

- **Dogs:** 5 mg/kg pyrantel + 20 mg/kg oxantel p.o., repeat as required.  
  This is equivalent to 1 tablet/2 kg (Dolpac for Small Dogs), 1 tablet/10 kg (Dolpac for Medium Dogs), or 1 tablet/25 kg (Dolpac for Large Dogs). For Drontal doses see Febantel, Praziquantel.

- **Cats:** 57.5 mg pyrantel + 5 mg praziquantel/kg p.o. (Drontal cat: 1 tablet/4 kg.)

- **Small mammals:** Rodents: 50 mg/kg p.o., repeat as required.

- **Birds, Reptiles:** No information available.

**Pyridostigmine** (Mestinon*, Regonol*) POM

**Formulations:** Oral: 60 mg tablets.

**Action:** Reversible inhibitor of cholinesterase activity, with a similar mechanism of action to neostigmine, but with a slower onset of activity and longer duration of action. It inhibits the enzymic hydrolysis of acetylcholine by acetylcholinesterase and other cholinesterases, thereby prolonging and intensifying the physiological actions of acetylcholine. It may also have direct effects on skeletal muscle.

**Use:** Treatment of myasthenia gravis. It can also be used to reverse the neuromuscular blockade produced by competitive neuromuscular blockers, but in general is less effective than neostigmine. It may also have a role in treatment of paralytic ileus. It is specifically used to increase the activity of acetylcholine at nicotinic receptors and thereby stimulate skeletal muscle, the autonomic ganglia, and the adrenal medulla. However, it also prolongs the effect of acetylcholine released from postganglionic parasympathetic nerves and also from some postganglionic sympathetic nerves to produce peripheral actions which correspond to those of muscarine. The muscarinic actions primarily comprise vasodilation, cardiac depression, stimulation of the vagus and parasympathetic nervous system, and increases in lacrimal, salivary and other secretions. The dosage
should be reduced by 25% if muscarinic adverse effects appear. Treat muscarinic adverse effects with atropine. Animals with megaoesophagus should receive injectable therapy until able to swallow liquid or tablets.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid using in animals with concurrent respiratory illness, bradycardia, arrhythmias, myocardial disease, epilepsy, hypotension, hyperthyroidism and renal impairment.

**Adverse reactions:** Vomiting, increased salivation, diarrhoea and abdominal cramps. Clinical signs of overdosage are related to muscarinic adverse effects and are generally less severe for pyridostigmine than for other parasympathomimetics (particularly neostigmine) but may include bronchoconstriction, increased bronchial secretions, lacrimation, involuntary defecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation and weakness eventually leading to fasciculation and paralysis.

**Drug interactions:** Aminoglycosides, clindamycin, lincomycin and propranolol may antagonize the effect of pyridostigmine. Pyridostigmine may enhance the effect of suxamethonium but antagonize the effect of non-depolarizing muscle relaxants.

**DOSES**

**Dogs:** 0.2-5 mg/kg p.o. q8-12h.

**Cats:** 0.25 mg/kg p.o. q8-12h.

**Small mammals, Birds, Reptiles:** No information available.

**Pyrimethamine** (Daraprim*, Fansidar*) P

**Formulations:** Oral: 25 mg tablet. Fansidar also contains sulfadoxine.

**Action:** Interference with folate metabolism of the parasite and thereby prevents purine synthesis (and therefore DNA synthesis).

**Use:** Infections caused by *Toxoplasma gondii* and *Neospora caninum*. Used in birds to treat atoxoplasmosis, sarcocystis and leucocytozoonosis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Should not be used in pregnant or lactating animals without adequate folate supplementation.

**Adverse reactions:** Depression, anorexia and reversible bone marrow suppression (within 6 days of the start of therapy). Folate supplementation (5 mg/day) may prevent bone marrow suppression.

**Drug interactions:** Increased antifolate effect if given with phenytoin or sulphonamides. Folate supplementation for the host will reduce the efficacy of the drug if given concomitantly and should thus be given a few hours before pyrimethamine.
DOSES

Dogs, Cats: 1 mg/kg p.o. q24h for 3 days, then 0.5 mg/kg p.o. q24h.

Birds: 0.5-1 mg/kg p.o. q12h for 28 days.

Small mammals, Reptiles: No information available.

Pyriprole (Prac-tic) POM-V

Formulations: Topical: 125 mg/ml spot-on pipettes of various sizes.

Action: Interaction with ligand-gated (GABA) chloride channels, blocking pre- and postsynaptic transfer of chloride ions, leads to death of parasites.

Use: Treatment and prevention of flea infestations (Ctenocephalides canis, C. felis) and tick prevention in dogs >8 weeks and >2 kg. For treatment of flea infestations the additional use of an approved insect growth regulator is recommended. For large dogs, the 5 ml dose should be applied in 2-3 spots. Bathing is not recommended for 48 hours prior to and 24 hours after application.

Safety and handling: Normal precautions should be observed.

Contraindications: Safety has not been established in pregnant and lactating females. Do not use on cats or rabbits. May be harmful to aquatic organisms.

Adverse reactions: Local pruritus or alopecia may occur at the site of application.

Drug interactions: No information available.

DOSES

Dogs: Minimum dose 12.5 mg/kg topically q4wk.

Cats: Do not use.

Small mammals: Rabbits: do not use.

Birds, Reptiles: No information available.

Quinalbarbitone/Cinchocaine see Secobarbital

Quinidine (Kinidin Durules*, Quinidine sulphate*) POM

Formulations: Oral: 200 mg tablets; 250 mg sustained release tablets (Kinidin).

Action: Depresses conduction velocity, myocardial contractility and excitability, and prolongs the refractory period. Thus, conduction time is increased and the re-entry phenomenon is prevented. Quinidine has indirect antimuscarinic effects, decreases vagal tone and may improve conduction at the AV junction.
Use: Management of ventricular arrhythmias (VPCs), refractory supraventricular tachycardias (with caution) and acute atrial fibrillation in dogs. Rarely used. Patients exhibiting signs of toxicity or a lack of response should have their serum levels measured. Serum therapeutic levels are 0.0025-0.005 mg/ml in dogs. Toxic effects are not usually evident when serum levels are <0.01 mg/ml.

Safety and handling: Normal precautions should be observed.

Adverse reactions: Weakness, vomiting, diarrhoea, hypotension (especially with too rapid i.v. administration), widening of QRS and QT intervals, AV block and decreased contractility.

Drug interactions: Digoxin levels may be increased by quinidine. It is recommended that the dose of digoxin be decreased by half when adding quinidine and that serum drug levels of both quinidine and digoxin be assessed. The effect of neuromuscular blockers (e.g. atracurium, suxamethonium, tubocurarine) may be enhanced by quinidine. Drugs that alkalinize urine (e.g. antacids, carbonic anhydrase inhibitors, sodium bicarbonate, thiazide diuretics) reduce the excretion of quinidine, thus prolonging its half-life. The half-life of quinidine may be reduced by as much as 50% as a consequence of hepatic enzyme induction by phenobarbital or phenytoin. Cimetidine inhibits the metabolism of quinidine by inhibiting hepatic microsomal enzymes, thereby increasing its effect. Additive cardiac depressant effects and an increased risk of ventricular arrhythmias may result if quinidine is used with anti-arrhythmic drugs (e.g. procainamide). There is an increased risk of hypotension if quinidine is used with verapamil.

DOSES

Dogs: 6-11 mg/kg i.m., 6-20 mg/kg p.o. q6-8h.

Cats, Small mammals, Birds, Reptiles: No information available.

Ramipril (Vasotop) POM

Formulations: Oral: 0.625 mg, 1.25 mg, 2.5 mg, 5 mg tablets.

Action: Inhibits conversion of angiotensin I to angiotensin II, resulting in veno- and arteriodilation and decreased salt and water retention (reduced aldosterone production). In the kidney, due to efferent arteriolar dilation resulting in a reduced glomerular filtration pressure, proteinuria may be reduced.

Use: Treatment of CHF and hypertension. May reduce proteinuria seen in patients with diabetes mellitus, hypertension and protein-losing nephropathy. It is converted in the liver to ramiprilat, which is more potent and has a longer duration of action than enalaprilat and, because it is highly lipophilic, has a potentially better inhibition of tissue ACE.

Safety and handling: Normal precautions should be observed.
**Contraindications**: Use with caution in patients with renal dysfunction: dose must be reduced; monitor renal function after starting treatment.

**Adverse reactions**: Hypotension, renal impairment, hyperkalaemia, anorexia, vomiting and diarrhoea are the main adverse effects. Hypotension is the main concern if an overdose is given. Treat with normal saline to expand blood volume and support the blood pressure. Serum biochemical abnormalities reported in humans include hyperkalaemia, hyponatraemia, and increased liver enzymes and bilirubin. Hypersensitivity reactions, e.g. angioneurotic oedema, have been reported in humans.

**Drug interactions**: Concomitant treatment with NSAIDs, potassium-sparing diuretics and potassium supplementation may increase the risk of hyperkalaemia developing. The concurrent use of diuretics or vasodilators with ramipril may cause hypotension.

**DOSES**

*Dogs*: 0.125 mg/kg p.o. q24h.

*Cats, Small mammals, Birds, Reptiles*: No information available.

---

**Ranitidine** *(Ranitidine*, Zantac*) POM

**Formulations**: Injectable: 25 mg/ml solution.
Oral: 75, 150, 300 mg tablets; 15 mg/ml syrup.

**Action**: Ranitidine is a histamine (H2) receptor antagonist blocking histamine-induced gastric acid secretion. It is more potent than cimetidine but has lower bioavailability (50%) and undergoes hepatic metabolism. It also has some prokinetic effect through stimulation of local muscarinic acetylcholine receptors, which may be of benefit when gastric motility is impaired by gastritis or ulceration, and in feline idiopathic megacolon.

**Use**: Management of gastric and duodenal ulcers, idiopathic, uraemic or drug-related erosive gastritis, oesophagitis, and hypersecretory conditions secondary to gastrinoma, mast cell neoplasia or short bowel syndrome. Reduction of vomiting due to gastric ulceration is typically achieved in about 2 weeks. Animals should, however, be treated for at least 2 weeks after the remission of clinical signs, so a minimum treatment duration of 28 days is recommended. Absorption is not clinically significantly affected by food intake, anticholinergic agents, or antacids. Currently cimetidine is the only anti-ulcer drug with a veterinary market authorization. However, in situations where a GI prokinetic effect is desired, use of ranitidine may be justified under the cascade.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: No information available.

**Adverse reactions**: Rarely reported but include cardiac arrhythmias and hypotension, particularly if administered rapidly i.v.
Drug interactions: It is advisable, though not essential, that sucralfate is administered 2 hours before H₂ blockers. Stagger oral doses of ranitidine when used with other antacids, digoxin, ketoconazole or metoclopramide by 2 hours as it may reduce their absorption or effect.

DOSES
Dogs: 2 mg/kg slow i.v., s.c., p.o. q8-12h.
Cats: 2 mg/kg/day constant i.v. infusion, 2.5 mg/kg i.v. slowly q12h, 3.5 mg/kg p.o. q12h.
Small mammals: Ferrets: 3.5 mg/kg p.o. q12h.
Birds, Reptiles: No information available.

Resocortol butyrate (Pruban) POM-V
Formulations: Topical: 0.1% emulsion (cream).
Action: Alters DNA transcription, leading to alterations in cellular metabolism which result in anti-inflammatory, immunosuppressive and antifibrotic effects.
Use: For symptomatic treatment of localized pyotraumatic dermatitis (acute moist dermatitis). Microbial infections should be treated appropriately prior to use.
Safety and handling: Wear gloves when applying cream.
Contraindications: Caution in dogs <7 months as glucocorticoids are known to slow growth.
Do not use in pregnant or lactating bitches.
Adverse reactions: Protracted use of any topical glucocorticoid can result in epidermal atrophy. Patients should be monitored appropriately.
Drug interactions: No information available.
DOSES
Dogs: Apply a thin layer twice daily for 7-14 days.
Cats, Small mammals, Birds, Reptiles: No information available.

Retinol see Vitamin A

Rifampin (Rifampicin) (Rifadin*, Rifampicin*, Rimactane*) POM
Formulations: Oral: 150, 300 mg capsules; 20 mg/ml syrup.
Action: Bactericidal drug binding to the beta subunit of RNA polymerase and causing abortive initiation of RNA synthesis.
Use: Wide spectrum of antimicrobial activity including bacteria (particularly Gram-positives), Chlamydia, Rickettsia, some protozoans and poxviruses. Very active against Staphylococcus
aureus and Mycobacterium tuberculosis. Gram-negative aerobic bacteria are usually innately resistant. Obligate anaerobes (Gram-positive or -negative) are usually susceptible. Exact indications for small animal veterinary practice remain to be fully established. It has been suggested as part of the combination of treatments for atypical mycobacterial infections and for lesions in cats associated with Rhodococcus equi. It may also have a place in the management of chlamydophilosis, erlichiosis and bartonellosis. Chromosomal mutations readily lead to resistance, therefore rifampin should be used in combination with other antimicrobial drugs to prevent the emergence of resistant organisms. Various combinations of clarithromycin, enrofloxacin, clofaxamine and doxycycline have been used with rifampin in the management of mycobacteriosis. Until controlled studies are conducted to investigate the value of rifampin in these infections, recommendations remain empirical.

**Safety and handling:** Women of child-bearing age should not handle crushed or broken tablets or the syrup without the use of gloves.

**Contraindications:** Rifampin may be teratogenic at high doses and should not be administered to pregnant animals. It should not be administered to animals with liver disease.

**Adverse reactions:** In dogs, increases in serum levels of hepatic enzymes are commonly seen and this can progress to clinical hepatitis. Rifampin metabolites may colour urine, saliva and faeces orange-red.

**Drug interactions:** Rifampin is a potent hepatic enzyme inducer and increases the rate of metabolism of other drugs in humans, including barbiturates, theophylline and ketaconazole. Increased dosages of these drugs may be required if used in combination with rifampin.

**DOSES**

**Dogs, Cats:** 10-15 mg/kg p.o. q24h.

**Small mammals, Birds, Reptiles:** No information available.

**Ringer’s solution** see Appendix p.370

**Rocuronium** (Esmeron*) POM

**Formulations:** Injectable: 10 mg/ml solution.

**Action:** Inhibits the actions of acetylcholine at the neuromuscular junction by binding competitively to the nicotinic acetylcholine receptor on the post-junctional membrane.

**Use:** Provision of neuromuscular blockade during anaesthesia. This may be to improve surgical access through muscle relaxation, facilitate positive pressure ventilation or intraocular surgery. Rocuronium is very similar to vecuronium but it has a more rapid onset of action. Its availability in aqueous solution and longer shelf-life
increase convenience. Monitoring (using a nerve stimulator) and reversal of the neuromuscular blockade is recommended to ensure complete recovery before the end of anaesthesia. Hypothermia, acidosis and hypokalaemia will prolong the duration of action of neuromuscular blockade.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available. Renal and hepatic disease can prolong duration of action of rocuronium; atracurium is advised in this group of patients.

**Adverse reactions:** Causes an increase in heart rate and a mild hypertension when used at high doses.

**Drug interactions:** Neuromuscular blockade is more prolonged when vecuronium is given in combination with volatile anaesthetics, aminoglycosides, clindamycin and lincomycin.

**DOSES**

**Dogs:** 0.4 mg/kg i.v. followed, when required, by a maintenance dose of 0.16 mg/kg i.v. prn or continuous rate infusion of 0.2 mg/kg/h.

**Cats:** Not widely evaluated but has been used at 0.6 mg/kg i.v. in isoflurane-anaesthetized cats. This dose had a rapid onset and short duration of action (20 min).

**Small mammals, Birds, Reptiles:** No information available.

---

**Salbutamol** (*Ventolin*) POM

**Formulations:** Inhalational: 100 µg per metered inhalation (Evohaler).

**Action:** Selective beta-2 stimulation causes smooth muscle relaxation and bronchodilation.

**Use:** Treatment of bronchospasm in inflammatory airway disease and irritation in cats and dogs.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** In humans side effects of the beta-2 agonists include headache, muscle cramps and palpitation. Other side effects include tachycardia, arrhythmias, peripheral vasodilation, and disturbances of sleep and behaviour.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 100-300 µg q4-6h or as needed for relief of bronchospasm.

**Cats:** 100 µg q4-6h or as needed for relief of bronchospasm.

**Small mammals, Birds, Reptiles:** No information available.
Secobarbital (Quinalbarbitone/Cinchocaine) (Somulose) 
POM-V

**Formulations:** Injectable: 400 mg/ml secobarbital with 25 mg/ml cinchocaine solution.

**Action:** Rapidly and profoundly depresses the CNS, including the respiratory centres. Cinchocaine has marked cardiotoxic effects at high doses. When given in combination, the barbiturate produces rapid loss of consciousness and cessation of respiration while the cinchocaine depresses cardiac conduction, resulting in early cardiac arrest. Since cardiac arrest is not dependent on development of profound hypoxia, euthanasia with Somulose is generally not accompanied by the gasping that may occur with other agents.

**Use:** For euthanasia of cats and dogs. Speed of injection is very important. An injection rate that is too slow may induce normal collapse but prolong the period until death. It is always advisable to have an alternative method of euthanasia available. Perivascular administration of secobarbital may delay the onset of effect and cause pain and result in excitement. Placement of a venous catheter is therefore recommended and care should be taken to ensure (by aspiration) that the injection is correctly placed in the vein.

**Safety and handling:** This is a potent drug which is rapidly and highly toxic to humans. Extreme care should be taken to avoid accidental self-administration. Use an i.v. catheter instead of a needle whenever possible. Only administer in the presence of an assistant/other individual. Wear suitable protective gloves when handling. Wash off splashes from skin and eyes immediately. In the event of accidental self-administration, by injection or skin absorption, do not leave the person unattended, seek urgent medical assistance advising medical service of barbiturate and local anaesthetic poisoning, and show the label advice to a doctor. Maintain airways in the injured person and give symptomatic and supportive treatment. Cinchocaine can cause hypersensitivity following skin contact; this can lead to contact dermatitis, which can become severe.

**Contraindications:** Somulose must not be used for anaesthesia as it is non-sterile.

**Adverse reactions:** No information available

**Drug interactions:** No information available.

**DOSES**

*Dogs, Cats:* 0.25 ml/kg i.v. Inject over 10-15 seconds to minimize premature cardiac arrest.

*Small mammals, Birds, Reptiles:* No information available.

**Selamectin** (Stronghold) POM-V

**Formulations:** Topical: Spot-on pipettes of various sizes containing 6% or 12% selamectin.
**Action:** Interacts with GABA and glutamate-gated channels leading to flaccid paralysis of parasite.

**Use:** Treatment and prevention of flea infestation (*Ctenocephalides felis, C. canis*), ear mite infestation (*Otodectes cynotis*), sarcoptic acarasis (*Sarcoptes scabiei var. canis*), biting lice (*Trichodectes canis*), adult roundworms (*Toxocara canis*) and prevention of heartworm disease (*Dirofilaria immitis*) in dogs. In cats used for treatment of adult roundworms (*Toxocara cati*), hookworm (*Ancylostoma tubaeforme*) and biting lice (*Felicola subrostratus*). Frequent shampooing may reduce the efficacy of the product.

**Safety and handling:** Highly toxic to aquatic organisms; therefore, take care with disposal.

**Contraindications:** Not for use in cats and dogs <6 weeks.

**Adverse reactions:** Transient pruritus and erythema at the site of application may occur.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** Minimum dose recommendation 6 mg/kg. For effective treatment of sarcoptic mange apply product on three occasions at 2-week intervals.

**Cats:** Minimum dose recommendation 6 mg/kg as required.

**Small mammals:** Rabbits, Rodents: 6 mg/kg monthly.

**Birds, Reptiles:** No information available.

---

**Selegiline** (*L*-Deprenyl) *(Selgian)* POM

**Formulations:** Oral: 4 mg, 10 mg tablets.

**Action:** Selegiline modifies the concentration of monoaminergic neurotransmitters, especially phenylethylamine and dopamine, and also appears to have neuroprotective properties.

**Use:** Authorized for the treatment of behavioural disorders of purely emotional origin, such as depression and anxiety, and, in association with behaviour therapy, for the treatment of signs of emotional origin observed in behavioural conditions such as overactivity, separation problems, generalized phobia and unsocial behaviour. These emotional disorders are characterized by a modification of feeding, drinking, autostimulatory behaviour, sleep, exploratory behaviour, aggression related to fear and/or irritation, social behaviour and somatic disorders (tachycardia, emotional micturition). It may also enhance learning in certain contexts and is indicated for the treatment of canine cognitive dysfunction, especially when signs of anxiety and/ or social withdrawal are associated with these problems. It may also be used to treat signs of cognitive decline in older cats. Treatment can be stopped suddenly without gradual dose reduction.

**Safety and handling:** Normal precautions should be observed.
**Contraindications:** Selegiline should not be used in animals with a known sensitivity to the drug or administered to lactating or pregnant bitches as it may act on prolactin secretion.

**Adverse reactions:** No information available

**Drug interactions:** Selegiline should not be administered with alpha-2 antagonists (or within 24 hours before or after their use), pethidine, fluoxetine, tricyclic antidepressants (e.g. amitryptiline, doxepin, clomipramine), ephedrine, potential monoamine oxidase inhibitors (e.g. amitraz) or phenothiazines. The effect of morphine is potentiated when used simultaneously. Potential interactions with metronidazole, prednisolone and trimethoprim may exist.

**DOSES**

* Dogs: 0.5-1 mg/kg p.o. q24h for a minimum of 2 months.

* Cats: 1 mg/kg p.o. q24h.

* Small mammals, Birds, Reptiles: No information available.

---

**Sertraline** (Lustral*) POM

**Formulations:** Oral: 50 mg, 100 mg tablets.

**Action:** Blocks serotonin re-uptake in the brain, resulting in antidepressive activity and a raising in motor activity thresholds.

**Use:** Treatment of compulsive type behaviour including acral lick in dogs. The atypical tricyclic antidepressant clomipramine is authorized for use in dogs.

**Contraindications:** Known sensitivity to sertraline or other SSRIs, history of seizures.

**Adverse reactions:** Possible reactions include lethargy, decreased appetite and vomiting. Trembling, restlessness, GI disturbance and an apparent paradoxical increase in anxiety may occur in some cases. Owners should be warned of a potential increase in aggression in response to medication.

**Drug interactions:** Sertraline should not be used within 2 weeks of treatment with an MAOI (e.g. selegiline) and an MAOI should not be used within 6 weeks of treatment with sertraline. Sertraline, like other SSRIs, antagonizes the effects of anticonvulsants and so is not recommended for use with epileptic patients or in association with other agents which lower seizure threshold, e.g. phenothiazines. Caution is warranted if sertraline is used concomitantly with aspirin or other anticoagulants since the risk of increased bleeding in the case of tissue trauma may be increased.

**DOSES**

* Dogs: 1-3 mg/kg p.o. q24h.

* Cats, Small mammals, Birds, Reptiles: No information available.
Serum gonadotrophin (PMSG, Equine chorionic gonadotrophin) (Folligon, PMSG-Intervet*) POM-V

Formulations: Injectable: 1000 IU freeze-dried plug.

Action: Mimics action of FSH.

Use: Induction of oestrus by stimulation of ovarian follicle development. Increases spermatogenesis, though with low efficiency.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Anaphylactoid reactions may occur rarely.

Drug interactions: No information available.

DOSES

Dogs:

• Oestrus induction: 20 IU/kg s.c. q24h for 10 days, followed by 500 IU hCG i.m. on day 10.
• To stimulate spermatogenesis: 400-800 IU i.m. twice weekly for 4-8 weeks.

Small mammals: Guinea pigs: 1000 IU/animal i.m., repeat in 7-10 days.

Cats, Birds, Reptiles: No information available.

Sevoflurane (SevoFlo) POM-V

Formulations: Inhalational: 250 ml bottle.

Action: The mechanism of action of volatile anaesthetic agents is not fully understood.

Use: Induction and maintenance of anaesthesia. Sevoflurane is potent and highly volatile so should only be delivered from a suitable calibrated vaporizer. It is less soluble in blood than halothane and isoflurane; therefore induction and recovery from anaesthesia are quicker. Sevoflurane has a less pungent smell than isoflurane and induction of anaesthesia using chambers or masks is usually well tolerated in small dogs and cats. The concentration of sevoflurane required to maintain anaesthesia depends on the other drugs used in the anaesthesia protocol (see Appendix); the concentration should be adjusted according to clinical assessment of anaesthetic depth. The cessation of administration results in rapid recovery, which may occasionally be associated with signs of agitation. Sevoflurane does not sensitize the myocardium to catecholamines to the extent that halothane does.

Safety and handling: Measures should be adopted to prevent contamination of the environment.

Contraindications: Sevoflurane is degraded by soda lime to compounds that are nephrotoxic in rats (principally Compound A). Conditions accelerating degradation (i.e. low gas flows, high absorbent temperatures and high sevoflurane concentrations) should
be avoided in long operations, although no studies in dogs have demonstrated Compound A to accumulate in concentrations capable of causing renal toxicity.

**Adverse reactions:** Causes a dose-dependent hypotension that does not wane with time. The effects of sevoflurane on respiration are dose-dependent and comparable to isoflurane, i.e. more depressant than halothane. Sevoflurane crosses the placental barrier and will affect neonates delivered by caesarean section.

**Drug interactions:** Opioid agonists, benzodiazepines and nitrous oxide reduce the concentration of sevoflurane required to achieve surgical anaesthesia. The effects of sevoflurane on the duration of action of non-depolarizing neuromuscular blocking agents are similar to those of isoflurane, i.e. greater potentiation compared with halothane.

**DOSES**

**Dogs, Cats, Small mammals, Birds:** The expired concentration required to maintain surgical anaesthesia in 50% of recipients is about 2.5% in animals (minimum alveolar concentration). Administration of other anaesthetic agents and opioid analgesics reduces the dose requirement of sevoflurane; therefore the dose should be adjusted according to individual requirement. 6-8% sevoflurane concentration is required to induce anaesthesia in unpremedicated patients.

**Reptiles:** Induction: 6-8% in 100% oxygen; Maintenance: 3-5% in 100% oxygen.

**Sildenafil** *(Viagra®)* POM

**Formulations:** Oral: 25 mg, 50 mg, 100 mg tablets.

**Action:** Vasodilation, due to an increase in vascular levels of cGMP caused by inhibition of cGMP-specific phosphodiesterase type V.

**Use:** Indicated for the treatment of pulmonary arterial hypertension. The very limited clinical experience with this drug in dogs suggests that the upper end of the dose range is safe and efficacious.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Systemic hypotension, significant hepatic or renal impairment or bleeding disorders.

**Adverse reactions:** Vomiting, dizziness and raised intraocular pressure.

**Drug interactions:** Cimetidine, erythromycin, itraconazole and ketoconazole increase plasma sildenafil concentration. Avoid concomitant use of nitrates, which significantly enhance its hypotensive effect.

**DOSES**

**Dogs:** 0.3-3 mg/kg p.o. q6-8h.

**Cats, Small mammals, Birds, Reptiles:** No information available.
Silver sulfadiazine (Flamazine*) POM
Formulations: Topical: 1% cream (water-soluble).
Action: Slowly releases silver in concentrations that are toxic to bacteria and yeasts. The sulfadiazine component also has anti-infective qualities.
Use: Topical antibacterial and antifungal drug particularly active against Gram-negative organisms such as *Pseudomonas aeruginosa*. Used in the management of second and third degree burns. Up to 10% may be absorbed, depending on the size of area treated.
Safety and handling: Use gloves.
Contraindications: Do not use in neonates or pregnant animals.
Adverse reactions: Patients hypersensitive to sulphonamides may react to silver sulfadiazine. It may accumulate in patients with impaired hepatic or renal function.
Drug interactions: No information available.
DOSES
*Dogs, Cats, Birds:*
- Burns/skin infection: Apply antiseptically to the affected area to a thickness of approximately 1.5 mm. Initially, apply as often as necessary to keep wound covered, then reduce as healing occurs to once a day applications. Dressings may be applied if necessary. Keep the affected area clean.
- Otitis (resistant *Pseudomonas*/refractory *Malassezia*): Dilute 1:1 with water and apply topically.

*Small mammals*: No information available.
*Reptiles*: Apply topically to wounds q24-72h.

Sodium acetate/acetic acid (Walpole’s solution*) POM-V
Formulations: Urethral irrigation: 1.17% sodium acetate and glacial acetic acid.
Action: Acidity causes struvite to dissolve.
Use: Used to flush out struvite urethral calculi in cats and dogs.
Safety and handling: Normal precautions should be observed.
Contraindications: No information available.
Adverse reactions: No information available.
Drug interactions: No information available.
DOSES
*Dogs, Cats*: Flush the urethra with 1 ml of solution, repeating prn until the obstruction is breached.
*Small mammals, Birds, Reptiles*: No information available.
Sodium acid phosphate see Phosphate enema

Sodium bicarbonate (Sodium bicarbonate*) POM

**Formulations:** Injectable: 1.26%, 4.2%, 8.4% solutions for i.v. infusion. (8.4% solution = 1 mmol/ml). Oral: 300 mg, 500 mg, 600 mg tablets.

**Action:** Provision of bicarbonate ions.

**Use:** Management of severe metabolic acidosis, to alkalinate urine, and as an adjunctive therapy in the treatment of hypercalcaemic or hyperkalaemic crisis. Active correction of acid-base imbalance requires blood gas analysis. Do not attempt specific therapy unless this facility is immediately available. 1 g of sodium bicarbonate provides 11.9 mEq of Na\(^+\) and 11.9 mEq of bicarbonate.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** In hypocalcaemic patients use sodium bicarbonate cautiously and administer slowly. As oral sodium bicarbonate (especially at higher doses) may contribute significant amounts of sodium, use with caution in patients on salt restricted intakes, e.g. those with congestive heart failure.

**Adverse reactions:** Excessive use of sodium bicarbonate i.v. can lead to metabolic alkalosis, hypernatraemia, congestive heart failure, a shift in the oxygen dissociation curve causing decreased tissue oxygenation, and paradoxical CNS acidosis leading to respiratory arrest.

**Drug interactions:** Sodium bicarbonate is incompatible with many drugs and calcium salts: do not mix unless checked beforehand. Alkalization of the urine by sodium bicarbonate decreases the excretion of quinidine and sympathomimetic drugs, and increases the excretion of aspirin, phenobarbital and tetracyclines (especially doxycycline).

**DOSES**

**Dogs, Cats:**

- Severe metabolic acidosis: mmol NaHCO\(_3\) required = base deficit x 0.5 x body weight (kg) (0.3 is recommended instead of 0.5 in some references). Give half the dose slowly over 3-4 hours, recheck blood gases and clinically re-evaluate the patient. Avoid over-alkalinization.
- Acutely critical situations (e.g. cardiac arrest): 1 mmol/kg i.v. over 1-2 min followed by 0.5 mmol/kg at intervals of 10 min during the arrest.
- Adjunctive therapy of hypercalcaemia: 0.5-1 mmol/kg i.v. over 30 min.
- Adjunctive therapy of hyperkalaemia: 2-3 mmol/kg i.v. over 30 min.
• Metabolic acidosis secondary to renal failure or to alkalinize the urine: Initial dose 8-12 mg/kg p.o q8h and then adjust dose to maintain total CO₂ concentrations at 18-24 mEq/l. The dose may be increased to 50 mg/kg to adjust urine pH in patients with normal renal, hepatic and cardiac function.

Small mammals, Birds, Reptiles: No information available.

Sodium chloride (Aqupharm, Vetivex, Sodium chloride, Hypertonic saline) POM-V

Formulations: Injectable: 0.45% to 7% NaCl solutions; 0.18% NaCl with 4% glucose and 0.9% with 5% glucose solutions. Oral: 300 mg, 600 mg tablets. Ophthalmic: 5% ointment (compounded by an ocular pharmacy).

Action: Expands plasma volume and replaces lost extracellular fluid.

Use: When used for fluid replacement NaCl (0.45% and 0.9%) will expand the plasma volume compartment. Compared with colloids, 2.5 to 3.0 times as much fluid must be given because the crystalloid is distributed to other sites. Normal saline is also the treatment of choice for patients with hypercalcaemia or hyperchloraemic alkalosis. Sodium chloride solutions are often used as a drug diluent. Hypertonic saline is used to expand the circulating blood volume rapidly in animals with shock, particularly during the preoperative period. The hypertonic ophthalmic solution is used in the management of corneal oedema. Hypertonic saline solutions have very high sodium concentrations and it is important to monitor serum sodium concentrations before and after their administration; maintenance with an isotonic crystalloid is usually required after administration to correct electrolyte and fluid disturbances created by the administration of the hypertonic solution. Oral sodium supplementation is recommended by some authors in the long-term management of hypoadrenocorticism.

Safety and handling: Hypertonic saline solutions should be regarded as drugs and not as intravenous fluids and should be stored separately to prevent confusion.

Contraindications: No information available.

Adverse reactions: Peripheral oedema is more likely to occur after crystalloids because muscle and subcutaneous capillaries are less permeable to protein. Normal saline contains higher amounts of chloride than plasma, which will increase the risk of acidosis. The degree of acidosis is not likely to be a problem in a healthy patient but acidosis may be exacerbated in a compromised patient.

Hypertonic saline administered at fluid rates >1 ml/kg/min can cause a vagally mediated bradycardia, therefore the rate of fluid administration must be carefully controlled. Enteric-coated products for oral use may not be adequately absorbed by dogs and therefore may be of unpredictable efficacy. The ophthalmic ointment may cause a stinging sensation.
Drug interactions: No information available.

DOSES

Dogs, Cats:
- Fluid therapy: fluid requirements depend on the degree of dehydration and ongoing losses. In uncomplicated cases 0.45-3 % solutions should be administered at a dose of 50-60 ml/kg/day i.v., p.o. Higher doses are required if the animal is dehydrated. Solutions containing 0.9% to 3% NaCl are suitable for replacing deficits. Solutions containing 0.45% NaCl (with added potassium) are indicated for longer term maintenance.
- Hypotension/shock: 5% to 7.5% NaCl solutions (hypertonic saline) at doses of 3-8 ml/kg i.v. Solutions of this concentration are hypertonic, therefore they should be used with caution and with other appropriate fluid replacement strategies. Hypertonic NaCl may be combined with colloid solutions to stabilize the increase in vascular volume provided by the hypertonic solution.
- Salt-wasting syndromes (hypoadrenocorticism): 1-5 g p.o. q24h.
- Corneal oedema: apply a small amount of ointment q8-24h.

Small mammals, Birds, Reptiles: No information available.

Sodium chromoglycate see Sodium cromoglicate

Sodium citrate (Micolette*, Micralax*, Relaxit*) P

Formulations: Rectal: micro-enemas containing 450 ml sodium citrate with 45 mg sodium alkylsulphoacetate (Micralax) or 45 mg sodium lauryl sulphoacetate (Micolette) or 75 mg sodium lauryl sulphate (Relaxit).

Action: An osmotic laxative that causes water to be retained within the lumen of the GI tract. It is formulated with a stool softener that augments its action.

Use: Low volume enema used to treat constipation and to prepare the lower GI tract for proctoscopy and radiography.

Safety and handling: Normal precautions should be observed.

Contraindications: Not recommended for use in cases with inflammatory bowel disease.

Adverse reactions: Uncommon; largely due to water and electrolyte disturbances.

Drug interactions: No information available.

DOSES

Dogs, Cats: 1 enema inserted per rectum to full length of nozzle.

Small mammals, Birds, Reptiles: No information available.
**Sodium cromoglicate** (Sodium chromoglycate)  
(Rynacrom*, Sodium cromoglicate*) P, POM  
**Formulations:** Topical: 2%, 4% nasal/ocular drops.  
**Action:** Stabilizes mast cell membranes, preventing degranulation.  
**Use:** Management of allergic conjunctivitis and rhinitis. Action is localized to the site of application.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** No information available.  
**Adverse reactions:** May cause local irritation  
**Drug interactions:** No information available.  
**DOSES**  
*Dogs, Cats:* 1-2 drops in eye or nose q6h.  
*Small mammals, Birds, Reptiles:* No information available.

**Sodium stibogluconate** (Pentostam*) POM  
**Formulations:** Injectable: 100 mg/ml solution.  
**Action:** Active against the amastigote stages of *Leishmania*; exact mode of action unknown.  
**Use:** Treatment of leishmaniasis in dogs. Animals may be clinically normal after treatment but remain carriers, and follow-on treatment with allopurinol may be beneficial. Seek expert advice before treating leishmaniasis.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** Significant renal impairment; lactating animals. Use with caution in the face of hepatic impairment.  
**Adverse reactions:** Pain and inflammation at the injection site, anorexia and vomiting, and myalgia. Meglumine antimonate is said to be less toxic.  
**Drug interactions:** No information available.  
**DOSES**  
*Dogs:* 30-50 mg/kg i.v., s.c. q24h for 3-4 weeks. If giving i.v., administer slowly (over at least 5 min) to avoid cardiac toxicity.  
*Cats, Small mammals, Birds, Reptiles:* No information available.

**Somatotropin** (Growth hormone) (Genotropin*, Humatrope*, Norditropin*) POM  
**Formulations:** Injectable: 2-16 IU vials for reconstitution.  
**Action:** Recombinant human growth hormone that mimics growth hormone action in other species.  
**Use:** Treatment of growth hormone deficiency. Serum IGF-1 measurements may be helpful to monitor therapy.
Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Growth hormone is diabetogenic; monitor blood glucose. Antibody formation may limit its effectiveness in the long term. Local reactions may be seen; rotate injection sites.

Drug interactions: No information available.

DOSES

Dogs, Cats: 0.3-0.7 IU/kg weekly divided into 3-5 doses s.c., i.m. (painful). Continue for at least 6 weeks to evaluate response.

Small mammals, Birds, Reptiles: No information available.

Sotalol (Beta Cardone*, Sotacor*, Sotalol*) POM

Formulations: Oral: 40 mg, 80 mg, 160 mg, 200 mg tablets. Injectable: 10 mg/ml solution.

Action: Produces a marked prolongation of action potential duration and refractoriness, with no effect on conduction. The effects are most likely caused by selective inhibition of potassium channels.

Use: Treatment of severe supraventricular or ventricular dysrhythmias. The beta blocking activity is about one third that of propranolol. Used most commonly in dogs with DCM showing severe ventricular arrhythmias. Preferable to assess efficacy with repeated Holter ECG monitoring.

Safety and handling: Normal precautions should be observed.

Contraindications: Asthma, sinus bradycardia, AV heart block or uncontrolled CHF. Caution in cases of renal failure.

Adverse reactions: The non-selective beta-blocking effects can decrease heart rate, stroke volume and cardiac output in dogs and may precipitate congestive cardiac failure. The drug is eliminated in urine and faeces and elimination half-life may increase greatly with renal insufficiency, leading to accumulation at standard doses. Adverse effects include hypotension, bradydysrhythmias, depression, nausea, vomiting and diarrhoea. The drug is potentially pro-arrhythmic and can cause torsades de pointes, especially if hypokalaemia is present.

Drug interactions: Sympathomimetics (metaproterenol, terbutaline, phenylpropanolamine, beta effects of adrenaline, etc.) may have their actions blocked by sotalol and they may, in turn, reduce the efficacy of sotalol. Additive myocardial depression may occur with the concurrent use of sotalol and myocardial depressant anaesthetic agents. Phenothiazines, furosemide, hydralazine and other drugs that cause hypotension may increase the hypotensive effects of atenolol. Sotalol may prolong the hypoglycaemic effects of insulin therapy. Concurrent use of beta-blockers with calcium-channel blockers (or other negative inotropics) should be done with caution, particularly in patients with pre-existing cardiomyopathy or CHF.
DOSES

**Dogs:** 0.5-2 mg/kg p.o. q12h. Start with lower doses if myocardial function is reduced. No data available on i.v. doses.

**Cats, Small mammals, Birds, Reptiles:** No information available.

**Spironolactone** (Aldactone*, Spironolactone*, Prilactone) POM, POM-V

**Formulations:** Oral: 25 mg, 50 mg, 100 mg tablets; 1 mg/ml, 2 mg/ml, 5 mg/ml, 10 mg/ml, 20 mg/ml syrups.

**Action:** Potassium-sparing diuretic that competitively inhibits aldosterone, preventing sodium resorption in the distal tubule.

**Use:** Oedema or ascites due to congestive heart failure (when hypokalaemia may potentiate digoxin toxicity) and hepatic failure (when hypokalaemia can precipitate hepatic encephalopathy). Hyperaldosteronism due to adrenal tumours. This is a weak diuretic which is normally used in conjunction with more potent diuretics such as furosemide. However, it may also have additional beneficial effects on the myocardium, possibly reducing progression of left ventricular dysfunction in progressive heart disease.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Any condition involving hyperkalaemia, e.g. Addison’s disease, anuria, acute renal failure. Caution in animals with renal or hepatic dysfunction.

**Adverse reactions:** Hyponatraemia and hyperkalaemia may develop. Discontinue if hyperkalaemia occurs. Hepatotoxicity is reported in humans.

**Drug interactions:** Potentiates thiazide and loop diuretics. Hyperkalaemia may result if ACE inhibitors (e.g. captopril, enalapril), NSAIDs, ciclosporin or potassium supplements are administered in conjunction with spironolactone. However, in practice spironolactone and ACE inhibitors appear safe to use concurrently. There is an increased risk of nephrotoxicity if spironolactone is administered with NSAIDs. The plasma concentration of digoxin may be increased by spironolactone.

**DOSES**

**Dogs, Cats:** 2-4 mg/kg p.o. q24h.

**Small mammals, Birds, Reptiles:** No information available.

**Sterculia** (Peridale, Normacol*) AVM-GSL, GSL

**Formulations:** Oral: 98% granules (Peridale), 118 mg capsules (Normacol).

**Action:** Bulk-forming agent that increases faecal mass and stimulates peristalsis.
**Use:** Management of impacted anal sacs, diarrhoea and constipation, and the control of stool consistency after surgery. Sterculia is inert and not absorbed. During treatment, fluid should be provided or a moist diet given. As the preparations swell in contact with water, they should be administered with plenty of water available.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in cases of intestinal obstruction or where enterotomy or enterectomy is to be performed.

**Adverse reactions:** No information available.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 1.5 g p.o. q24h (dogs <5kg); 3 g p.o. q12-24h (5-15 kg); 4 g p.o. q12-24h (>15 kg). Sprinkle over feed or place on tongue.

**Cats:** Kittens: 1 capsule q24h; Adults: 1 capsule q12h.

**Small mammals, Birds, Reptiles:** No information available.

---

**Streptokinase** (Streptokinase*) POM

**Formulations:** Injectable: 250,000 IU, 750,000 IU, 1,500,000 IU powders for reconstitution.

**Action:** Plasminogen activation forms plasmin, which degrades fibrin and leads to thrombin dissolution.

**Use:** Management of life-threatening thrombosis and pulmonary thromboembolism. Alteplase (Actilyse*) and anistreplase (Eminase*) are similar, but very expensive, drugs that have more specific actions and result in less bleeding. Mortality rates from this treatment are very high.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Include recent haemorrhage, trauma, surgery and coagulopathies.

**Adverse reactions:** Nausea, vomiting and bleeding are the main adverse effects. If bleeding is severe, stop administration and use antifibrolytic drugs (e.g. aprotonin). Streptokinase is a bacterial product and therefore anaphylaxis may be seen with repeated use. In humans it is recommended that this product should not be administered for >4 days.

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 90,000 IU i.v. infusion over 30-60 min as a loading dose followed by 45,000 IU/h i.v. infusion.

**Cats:** 90,000 IU i.v. infusion as a loading dose, followed by 45,000 IU/h i.v. infusion.

**Small mammals, Birds, Reptiles:** No information available.
**Streptomycin** (Duphapen + Strep) POM-V

**Formulations:** Injectable: Duphapen + strep contains dihydrostreptomycin (250 mg/ml) and procaine penicillin (200 mg/ml).

**Action:** Inhibits bacterial protein synthesis, resulting in a bactericidal effect that is concentration-dependent.

**Use:** Active against a range of Gram-negative and some Gram-positive pathogens although resistance is quite widespread and it is less active than other aminoglycosides. It is specifically indicated in the treatment of infections caused by *Leptospira* and *Mycobacterium tuberculosis* (in combination with other drugs). Aminoglycosides require an oxygen-rich environment to be effective, thus they are ineffective in sites of low oxygen tension (abscesses, exudates) and all obligate anaerobes are resistant. There is currently no authorized preparation for use in dogs. Use of streptomycin is limited and if an aminoglycoside is indicated other members of the family are more commonly employed, e.g. gentamicin. There is a marked post-antibiotic effect, allowing the use of pulse-dosing regimens which may limit toxicity. Dosing 2-3 times a week is used to treat mycobacteriosis in humans.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in cats. Use with caution in birds as it is toxic, especially to raptors. Do not use combination product in rats as procaine is toxic to them.

**Adverse reactions:** Streptomycin is ototoxic, interfering with balance and hearing, which can be permanent. Nephrotoxicosis may be a problem but is less likely than with other aminoglycosides. Toxic to raptors.

**Drug interactions:** Increased risk of nephrotoxicity when used with cephalosporins (notably cefalothin) and cytotoxic drugs. Ototoxicity is increased with cisplatin and loop diuretics. The effects of neostigmine and pyridostigmine may be antagonized by aminoglycosides. The effect of non-depolarizing muscle relaxants, e.g. pancuronium, may be enhanced. Penicillin and streptomycin act synergistically. Aminoglycosides may be chemically inactivated by beta-lactam antibiotics (e.g. penicillins, cephalosporins) or heparin when mixed *in vitro*.

**DOSES**

*Dogs:* 25 mg/kg i.m. q24h.

*Cats:* Do not use.

*Small mammals:* Rabbits, Hamsters: 25-50 mg/kg i.m., s.c. q24h.

*Birds:* 10-30 mg/kg i.m. q8-12h.

*Reptiles:* No information available.

**Succinylcholine** see Suxamethonium
Sucralfate (Antepsin*, Antepsin suspension*, Carafate*) POM

Formulations: Oral: 1 g tablet; 0.2 g/ml suspension.

Action: In an acidic medium an aluminium ion detaches from the compound, leaving a very polar, relatively non-absorbable ion. This ion then binds to proteinaceous exudates in the upper GI tract, forming a chemical diffusion barrier over ulcer sites, preventing further erosion from acid, pepsin and bile salts. However, its major action appears to relate to stimulation of mucosal defences and repair mechanisms (stimulation of bicarbonate and PGE production and binding of epidermal growth factor). These effects are seen at neutral pH.

Use: Treatment of oesophageal, gastric and duodenal ulceration, usually with an H2 receptor antagonist or proton pump inhibitor but given separately. The efficacy of sucralfate as a phosphate binder in renal failure is uncertain.

Safety and handling: Normal precautions should be observed.

Contraindications: Perforated ulcer.

Adverse reactions: Minimal; constipation is the main problem in humans. Bezoar formation and hypophosphataemia are also reported in humans.

Drug interactions: Sucralfate may decrease the bioavailability of H2 antagonists, phenytoin and tetracycline. Although there is little evidence to suggest that this is of clinical importance, it may be a wise precaution to administer sucralfate at least 2 hours before these drugs. Sucralfate interferes significantly with the absorption of fluoroquinolones and digoxin.

DOSES

Dogs: 500 mg/dog p.o. q6-8h (dogs up to 20 kg); 1-2 g/dog p.o. q6-8h (>20 kg).

Cats: 250 mg/cat p.o. q8-12h.

Small mammals: Ferrets: 25-125 mg/kg q8-12h; Rodents: 25-50 mg/kg p.o. q6-8h.

Birds: 25 mg/kg p.o. q8h.

Reptiles: 500-1000 mg/kg p.o. q6-8h.

Sulfadimethoxine (Coxi Plus) POM-V

Formulations: Oral: 1000 mg/4 g sachet.

Action: Competitively inhibits bacterial and protozoal synthesis of folic acid.

Use: Coccidiosis in reptiles and pigeons; coccidiosis and atoxoplasmosis in passerine birds.

Safety and handling: Normal precautions should be observed.

Contraindications: Be careful in use with reptiles with reduced renal function, renal failure or dehydration.
Adverse reactions: No information available
Drug interactions: No information available.

DOSES
Dogs, Cats: No information available.
Small mammals: 10-15 mg/kg p.o. q12h.

Birds: 1 g/l of drinking water daily for 2 days, then 3 days off and 2 days on.

Reptiles: 90 mg/kg p.o. once; then 45 mg/kg p.o. q24h for 5-7 days.

Sulfasalazine (Salazopyrin*, Sulphasalazine*) POM
Formulations: Oral: 500 mg tablet; 250 mg/ml oral suspension.

Action: Sulfasalazine is a pro-drug: a diazo bond binding sulfapyridine to 5-ASA is cleaved by colonic bacteria to release free 5-ASA, which acts locally in high concentrations in the colon as an anti-inflammatory.

Use: Used in the management of colitis. There is a significant risk of keratoconjunctivitis sicca and periodic Schirmer tear tests should be performed.

Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Uncommon but include keratoconjunctivitis sicca (KCS), vomiting, allergic dermatitis and cholestatic jaundice. Owners should be made aware of the seriousness of KCS and what signs to monitor. The cause of the KCS is not clear. Historically sulfapyridine has been blamed. Olsalazine has been recommended as the incidence of KCS is less with its use, though not completely abolished. It is possible that 5-ASA may sometimes be responsible.

Drug interactions: The absorption of digoxin may be inhibited by sulfasalazine, and the measurement of serum folate concentration may be interfered with. Sulfasalazine may cause a reduction in serum thyroxine concentrations.

DOSES
Dogs: 15-30 mg/kg p.o. q8-12h, maximum 6 g/day.
Cats: 10-20 mg/kg p.o. q8-12h.

Small mammals, Birds, Reptiles: No information available.

Sulphonamide see Trimethoprim/Sulphonamide
**Suxamethonium** *(Succinylcholine) (Suxamethonium*) POM

**Formulations:** Injectable: 50 mg/ml solution.

**Action:** Competitively binds to the nicotinic acetylcholine receptor. The persistent depolarization prevents the transmission of further action potentials, resulting in muscle relaxation.

**Use:** Used to facilitate intubation in cats and primates. There are no indications for suxamethonium in dogs. Suxamethonium has a very rapid onset of action (5-15 s) and short duration of action (3-5 min). However, use of neuromuscular blockade to facilitate intubation is rarely required in small animals and suxamethonium has been largely replaced by non-depolarizing drugs.

**Safety and handling:** Store in refrigerator.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available. Use with caution in patients with hepatic disease. Do not use in animals exposed to organophosphate compounds.

**Adverse reactions:** Can cause arrhythmias (sinus bradycardia, ventricular arrhythmias) via stimulation of muscarinic receptors in the sinus node. A small rise in potassium concentration is expected after suxamethonium; patients with burns and neuromuscular disorders are at severe risk of hyperkalaemia.

**Drug interactions:** The actions of suxamethonium may be enhanced by beta-adrenergic blockers (e.g. propanolol), furosemide, isoflurane, lidocaine, magnesium salts, phenothiazines and procainamide. Diazepam may reduce the duration of action of suxamethonium. Neostigmine and pyridostigmine should not be administered with suxamethonium as they inhibit pseudocholinesterases, thereby enhancing suxamethonium’s effect.

**DOSES**

**Dogs:** Do not use.

**Cats:** 1.0 mg/kg i.v.. A total dose of 3.5 mg is satisfactory in cats >3.5 kg.

**Small mammals, Birds:** No information available.

**Reptiles:** Reptiles: 0.25-1 mg/kg i.m.

**T3** see [Liothyronine](#)

**T4** see [Levothyroxine](#)

**Tacrolimus** *(FK 506) (Protopic*) POM

**Formulations:** Topical: 0.03%, 0.1% creams.

**Action:** T lymphocyte inhibition.
Use: Recently described for topical ophthalmic use as the aqueous formulation to treat canine keratoconjunctivitis sicca that is unresponsive to topical ciclosporin. Has also been used for localized autoimmune dermatoses. Long-term effects, potential adverse effects and toxicities are as yet unknown and tacrolimus must be reserved for special cases only. Although the limited studies to date have used aqueous formulations, there are also anecdotal reports that the skin cream formulation has been used successfully

Safety and handling: Use gloves.
Contraindications: No information available.
Adverse reactions: Discomfort on application (blepharospasm).
Drug interactions: No information available.

DOSES
Dogs: Apply small amount of ointment to the affected eye q12h.
Cats, Small mammals, Birds, Reptiles: No information available.

Tepoxalin (Zubrin) POM-V
Formulations: Oral: 50 mg, 100 mg, 200 mg tablets.
Action: Reduction in both prostaglandin and leucotriene synthesis, leading to anti-inflammatory, analgesic and antipyretic effects. 5-Lipoxygenase enzyme inhibition may be associated with an improved GI safety profile compared to some other NSAIDs.
Use: Control of musculoskeletal pain and inflammation in dogs, particularly that associated with osteoarthritis. Tepoxalin is not COX-2 selective and is not authorized for preoperative administration to dogs. After placing the tablet in the dog’s mouth, keep the mouth closed for approximately 4 seconds to ensure that the drug is fully dispersed. Administer the tablets within 1-2 hours of feeding. The tablets can also be placed in moist food or treat and offered to the dog immediately. Long-term treatment to manage chronic conditions should be accompanied by regular examination of the animal for signs of adverse effects.

Safety and handling: The tablets are lyophilisates designed to dissolve rapidly in water. Ensure that they are handled with dry hands to prevent dissolution during administration.

Contraindications: Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Do not administer perioperatively until the animal is fully recovered from anaesthesia and normotensive. Liver disease will prolong the metabolism of tepoxalin, leading to the potential for drug accumulation and overdose with repeated dosing. Administration to animals with renal disease must be carefully evaluated. Do not give to pregnant animals, as tepoxalin has not been evaluated in animals <6 months.
**Adverse reactions:** GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

**Drug interactions:** Do not administer concurrently with, or within 24 hours of, other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

**DOSES**

**Dogs:** 10 mg/kg p.o. q24h with food.

**Cats:** No published data. Do not use.

**Small mammals, Birds, Reptiles:** No information available.

---

**Terbinafine** (Lamisil*) POM

**Formulations:** Oral: 250 mg tablets.

**Action:** Inhibits ergosterol synthesis by inhibiting squalene epoxidase, an enzyme that is part of the fungal cell wall synthesis pathway.

**Use:** Management of dermatophytosis, *Malassezia* dermatitis, subcutaneous and systemic fungal infections in cats and dogs. Optimal therapeutic regimes are still under investigation.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Vomiting, diarrhoea, increased liver enzymes, pruritus (cats).

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 5-50 mg/kg p.o. q24h.

**Small mammals:** Rodents: 10-30 mg/kg q24h p.o. for 4-6 weeks.

**Birds:** 10-15 mg/kg p.o. q12h, or nebulization of 1 mg/ml for 20 min q8h.

**Reptiles:** No information available.

---

**Terbutaline** (Bricanyl*, Monovent*) POM

**Formulations:** Injectable: 0.5 mg/ml solution.

Oral: 5 mg tablets; 1.5 mg/5 ml syrup.

**Action:** Selective beta-2 agonist that directly stimulates bronchodilation.

**Use:** Bronchodilation. Maintainence of heart rate in animals with sick sinus syndrome.
Safety and handling: Normal precautions should be observed.
Contraindications: Use with caution in patients with diabetes mellitus, hyperthyroidism, hypertension or seizure disorders.
Adverse reactions: Fine tremor, tachycardia, hypokalaemia, hypotension and hypersensitivity reactions. Administration i.m. may be painful.
Drug interactions: There is an increased risk of hypokalaemia if theophylline or high doses of corticosteroids are given with high doses of terbutaline. Use with digitalis glycosides or inhalational anaesthetics may increase the risk of cardiac arrhythmias. Beta blockers may antagonize its effects. Other sympathomimetic amines may increase the risk of adverse cardiovascular effects.

DOSES
Dogs: 1.25-5 mg/dog p.o. q8-12h, 0.01 mg/kg i.m., s.c. q4h.
Cats: 0.312-1.25 mg/cat p.o. q8-12h, 0.015 mg/kg i.m., s.c. q4h.
Small mammals, Birds, Reptiles: No information available.

**Testosterone (Durateston) POM-V**

Formulations: Injectable: 50 mg/ml comprising 6 mg/ml testosterone propionate, 12 mg/ml testosterone phenylpropionate, 12 mg/ml testosterone isocaproate and 20 mg/ml testosterone decanoate.

Action: Male androgenic steroid.

Use: Management of feminization associated with oestrogen-producing testicular tumours, suppression of oestrus in the bitch, false pregnancy and testosterone-responsive incontinence and alopecia in male dogs.

Safety and handling: Normal precautions should be observed.

Contraindications: Include prostatic enlargement, perineal hernia, recurrence or exacerbation of perianal adenomas, cardiac insufficiency, liver or renal disease. Do not use in pregnant animals.

Adverse reactions: Use of testosterone in male cats may cause spraying. Administration of androgens to prepubertal animals may result in early closure of epiphyseal growth plates. Undesirable signs of virilization (low grade vaginitis, clitoral enlargement) may occur in certain individuals.

Drug interactions: Insulin requirements may be decreased in diabetic patients receiving androgenic therapy at normal doses. At higher doses insulin resistance may be encountered.

DOSES
Dogs: 2.5-10 mg/kg (0.05-0.2 ml) i.m., s.c. monthly.
Cats: 2.5-5 mg/kg (0.05-0.1 ml) i.m., s.c. monthly.
Small mammals, Birds, Reptiles: No information available.
**Tetanus antitoxin** (Tetanus antitoxin behring) POM-V  
**Formulations:** Injectable: 500-1500 IU/ml solution.  
**Action:** Antibody binds to tetanus toxin.  
**Use:** Preventive measure in animals at risk of developing tetanus from wounds. In established tetanus cases it is less effective as it does not displace bound toxin. Best used in developing cases of tetanus (i.e. immediately clinical signs are seen when contamination of wound is severe and progression to a severe form of tetanus is possible). Risk of tetanus in dogs and cats is very low and therefore routine prophylaxis is not warranted.  
**Safety and handling:** Normal precautions should be observed.  
**Contraindications:** No information available.  
**Adverse reactions:** All antisera have the potential to produce anaphylactoid reactions, particularly if the patient has previously received products containing horse protein. Repeated doses may lead to hypersensitivity reactions. Adrenaline or antihistamines may be used to manage these adverse effects.  
**Drug interactions:** No information available.  
**DOSES**  
**Dogs, Cats:** Prophylactic: 500-1000 IU i.m., s.c. once. Therapy of developing tetanus: 100-500 IU/kg s.c. once, max. 20,000 IU.  
**Small mammals, Birds, Reptiles:** No information available.

**Tetracaine** (Amethocaine) (Amethocaine hydrochloride*) POM  
**Formulations:** Ophthalmic: 0.5%, 1% solution (single-use vials).  
**Action:** Local anaesthetic action is dependent on reversible blockade of the Na⁺ channel, preventing propagation of an action potential along the nerve fibre. Sensory nerve fibres are blocked before motor nerve fibres, allowing a selective sensory blockade at low doses.  
**Use:** Local anaesthesia of the ocular surface (cornea and conjunctival sac). Although effective, it is rarely used in veterinary practice. An alternative topical ophthalmic anaesthetic such as proxymetacaine is advised. Duration of action has not been reported in companion animal species. Topical anaesthetics block reflex tear production and should not be applied before a Schirmer tear test.  
**Safety and handling:** Store in refrigerator.  
**Contraindications:** All topical anaesthetics are toxic to the corneal epithelium, delay healing of ulcers and should not be used for therapeutic purposes.  
**Adverse reactions:** Tetracaine often causes marked conjunctival irritation, chemosis and pain on application.  
**Drug interactions:** No information available.
DOSES

**Dogs, Cats, Small mammals:** Ophthalmic: 1 drop per eye, single application.

**Birds, Reptiles:** No information available.

---

**Tetracosactide** (Tetracosactrin, ACTH) (Synacthen*) POM

**Formulations:** Injectable: 0.25 mg/ml solution.

**Action:** ACTH analogue that binds to specific receptors on the cell membrane of adrenocortical cells and induces the production of steroids from cholesterol.

**Use:** To stimulate cortisol production in the diagnosis of hyperadrenocorticism (Cushing’s syndrome) and hypoadrenocorticism (Addison’s disease). See *BSAVA Manual of Canine and Feline Endocrinology* for advice on performance and interpretation of ACTH stimulation test.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** None reported.

**Drug interactions:** None reported.

**DOSES**

**Dogs:** 0.125 mg i.v. (dogs up to 5 kg) or 0.25 mg i.v. (>5 kg). Doses as low as 0.005 mg/kg have been shown to be effective in stimulating cortisol production.

**Cats:** 0.125 mg i.v. (up to 5 kg BW)

**Small mammals, Birds, Reptiles:** No information available.

---

**Tetracosactrin** see Tetracosactide

**2,2,2-Tetramine** see Trientine

---

**Theophylline** (Corvental-D) POM-V

**Formulations:** Oral: 100 mg, 200 mg, 500 mg sustained-release capsules.

**Action:** Causes inhibition of phosphodiesterase, alteration of intracellular calcium, release of catecholamine, and antagonism of adenosine and prostaglandin, leading to bronchodilation and other effects.

**Use:** Treatment of small airway disease. Beneficial effects include bronchodilation, enhanced mucociliary clearance, stimulation of the respiratory centre and increased sensitivity to $P_aCO_2$, increased diaphragmatic contractility, stabilization of mast cells, a mild inotropic effect and a mild diuretic action. Therapeutic plasma theophylline values are 5-20 µg/ml.
Safety and handling: Normal precautions should be observed.

Contraindications: No information available.

Adverse reactions: Vomiting, diarrhoea, polydipsia, polyuria, reduced appetite, tachycardia, arrhythmias, nausea, twitching, restlessness, agitation, excitement and convulsions. Hyperaesthesia is seen in cats. The severity of these effects may be decreased by the use of modified release preparations. They are more likely to be seen with twice-daily dosing.

Drug interactions: Phenobarbital and phenytoin may decrease theophylline’s effect. Plasma theophylline levels may be increased by cimetidine, diltiazem, erythromycin, fluoroquinolones and verapamil. Theophylline and beta-adrenergic blockers (e.g. propranolol) may antagonize each other. The concurrent use of theophylline with beta sympathomimetics is contraindicated, as additive or synergistic interactions may result in exaggerated adverse effects. There is an increased risk of dysrhythmias if theophylline is administered with halothane and an increased incidence of seizures if administered with ketamine.

DOSES

Dogs: 15-20 mg/kg p.o. q12-24h. Note: Manufacturer only recommends q24h dosing. Some texts indicate q12h dosing of the sustained release preparation is required to maintain therapeutic serum levels. Consider q12h dosing where the response to q24h dosing is inadequate.

Cats: 10 mg/kg p.o. q24h (sustained release preparation).

Small mammals, Birds, Reptiles: No information available.

Thiabendazole see Tiabendazole
Thiamine see Vitamin B1

Thiopental (Intraval sodium, Thiovet ) POM-V

Formulations: Injectable: 943 mg/g powder for reconstitution in 2.5 g and 5 g (large animal) vials.

Action: Barbiturates increase the duration of GABA-dependent chloride channel opening in the CNS. Increased chloride conductance leads to hyperpolarization and neuronal inhibition.

Use: An ultra-short-acting thiobarbiturate used by the i.v. route for the induction of anaesthesia. Sodium thiopental is a weak acid and forms an alkaline solution when dissolved in water; the 2.5% solution is stable for many days and should be bacteriostatic due to its pH of 10.5. Concentrations of 2.5 and 1.25 % should be used in small animals to avoid thrombophlebitis. Thiopental is metabolized slowly by the liver, initial recovery from anaesthesia is a dependent on redistribution of thiopental from the plasma to fat tissue. Repeated
doses rapidly saturate the fatty tissues, leading to a very prolonged recovery from anaesthesia. Use in animals with liver disease or immature liver function (< 3 months of age) can also lead to a prolonged recovery; propofol is the preferred agent in these cases. Critically ill patients tend to have a greater fraction of the drug in the unionized form and fewer plasma protein binding sites so that significantly less thiopental is required to induce anaesthesia. Recovery from anaesthesia can be even more prolonged in sighthounds; propofol is the preferred induction agent for these breeds. Propofol is also preferred to thiopental for induction of anaesthesia in dogs for caesarean section, as puppies may show significant CNS depression.

**Safety and handling:** Aqueous solutions are unstable if left for extended periods (more than 1 week), particularly when exposed to air.

**Contraindications:** No information available.

**Adverse reactions:** Thiopental causes myocardial depression and hypotension which may be compensated for by an increase in heart rate. Respiratory depression can also occur, particularly after rapid i.v. administration. Perivascular injection is painful (a low dose of lidocaine may provide analgesia if this occurs). Perivascular injection may also cause serious tissue necrosis if large doses extravasate; managed by injecting small volumes of sterile saline in the affected area to dilute the thiopental.

**Drug interactions:** No information available.

**DOSES**

* **Dogs, Cats:** Premedicated: 5-10 mg/kg; Unpremedicated: 10-20 mg/kg. Dose depends mainly on the degree of CNS depression caused by preanaesthetic medication.

* **Small mammals, Birds:** No information available.

* **Reptiles:** Do not use.

---

**Thiostrepton** (Panolog) POM-V

**Formulations:** Topical: 2,500 IU/ml ointment.

**Action:** Inhibits ribosome function in bacterial cells.

**Use:** A thioazole-containing antibiotic. Active against Gram-positive bacteria and used topically as part of a compound preparation containing triamcinolone, nystatin and neomycin for the management of localized skin conditions and otitis externa.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Mostly associated with the corticosteroid component of the preparation.

**Drug interactions:** No information available.
DOSES

* **Dogs, Cats:** Apply to affected area q6-12h.
* **Small mammals, Birds, Reptiles:** No information available.

**Thyroid stimulating hormone** (Thyrotropin alfa, TSH) (Thyrogen*) POM

**Formulations:** Injectable: 1.1 mg vial; after reconstitution with 1.2 ml sterile water the TSH concentration is 0.9 mg/ml.

**Action:** Binds to specific receptors on thyroid follicular cell membranes and in so doing stimulates the proteolytic degradation of thyroglobulin and the release of thyroxine (T4) and smaller quantities of tri-iodothyronine (T3).

**Use:** Stimulation of thyroid hormone production in the diagnosis of canine hypothyroidism. The diagnostic value in cats has not been fully assessed. No licensed preparation of TSH is currently available in the UK. Recombinant human TSH may be imported on a special licence.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Chemical grade TSH may be associated with anaphylactic responses; do not use. Too few dogs and cats have been treated with the recombinant preparation to assess the prevalence of this side effect. Repeated administration is not advisable.

**Adverse reactions:** No information available.

**Drug interactions:** Anabolic or androgenic steroids, carbimazole, barbiturates, corticosteroids, diazepam, heparin, mitotane (op'-DDD), nitroprusside, phenylbutazone, phenytoin and salicylates may all decrease serum T4 levels. Fluorouracil, insulin, oestrogens, propranolol and prostaglandins may cause T4 levels to be increased. All these drugs will make the TSH stimulation test hard to interpret.

**DOSES**

* **Dogs:** 50 to 100 µg/dog.
* **Cats:** 25 µg/cat.
* **Small mammals, Birds, Reptiles:** No information available.

**Thyrotropin alfa** see *Thyroid stimulating hormone*

**Thyrotropin releasing hormone** (TRH) (Protirelin*) POM

**Formulations:** Injectable: 200 µg/1 ml vial.

**Action:** TRH increases TSH production by the pituitary gland, stimulating thyroid hormone production by the thyroid gland.
Use: Used to assess pituitary and thyroid function in canine hypothyroidism and feline hyperthyroidism. The TRH stimulation test is of limited value in the diagnosis of canine hypothyroidism. TRH stimulation of TSH can be used to diagnose secondary (pituitary-dependent) hypothyroidism.

Safety and handling: Store in refrigerator.

Contraindications: No information available.

Adverse reactions: In cats is frequently associated with vomiting.

Drug interactions: Anabolic or androgenic steroids, carbimazole, barbiturates, corticosteroids, diazepam, heparin, mitotane (op’-DDD), nitroprusside, phenylbutazone, phenytoin and salicylates may all decrease serum T4 levels. Fluorouracil, insulin, oestrogens, propranolol and prostaglandins may cause T4 levels to be increased. All these drugs will make the TRH stimulation test hard to interpret.

DOSES

Dogs: 200 µg/dog i.v.
Cats: 4 µg/kg i.v.
Small mammals, Birds, Reptiles: No information available.

L-Thyroxine see Levothyroxine

Tiabendazole (Thiabendazole) (Auroto ear drops) POM-V

Formulations: Topical (aural): 4% solution combined with neomycin 0.5% and tetracaine hydrochloride.

Action: Fungicidal effect is due to the effect on the mitochondrial electron transport chain. The acaricidal effect is not understood.

Use: Management of Malassezia otitis externa and Otodectes cynotis infestations (additional topical acaricidal treatment on the hair coat advised). The regimen should continue or be repeated within a 3-week period.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use if tympanum is ruptured.

Adverse reactions: Ataxia, nystagmus and deafness may occur if used when the tympanum is ruptured.

Drug interactions: No information available.

DOSES

Dogs, Cats: 3-5 drops in affected ear(s) for 7 days.
Small mammals, Birds, Reptiles: No information available.
**Ticarcillin** (Timentin*) POM

**Formulations:** Injectable: 3 g ticarcillin and 200 mg clavulanic acid powder for reconstitution.

**Action:** Beta-lactam antibiotics bind penicillin-binding proteins involved in cell wall synthesis, decreasing bacterial cell wall strength and rigidity, and affecting cell division, growth and septum formation. The effect is bactericidal and killing occurs in a time-dependent fashion. Clavulanic acid acts as a non-competitive ‘suicide’ inhibitor for beta-lactamase enzymes.

**Use:** A carboxypenicillin that, like piperacillin, is indicated for the treatment of serious (usually but not exclusively life-threatening) infections caused by Pseudomonas aeruginosa, although it also has activity against certain other Gram-negative bacilli including Proteus spp. and Bacteroides fragilis. For Pseudomonas septicaemias antipseudomonal penicillins are often given with an aminoglycoside (e.g. gentamicin) as there is a synergistic effect. As ticarcillin kills bacteria by a time-dependent mechanism, dosing regimens should be designed to maintain tissue concentration above the MIC throughout the interdosing interval. Pharmacokinetic information on the ticarcillin/clavulanic acid combination is limited in veterinary species. After reconstitution it is stable for 48-72 hours.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not administer penicillins to hamsters, gerbils, guinea pigs, chinchillas or rabbits.

**Adverse reactions:** Nausea, diarrhoea and skin rashes may be seen.

**Drug interactions:** Do not mix with aminoglycosides in the same syringe because there is mutual inactivation. There is synergism in vivo between the beta-lactams and the aminoglycosides.

**DOSES**

*Dogs, Cats:* 40-100 mg/kg i.v., i.m. q4-6h.

*Small mammals:* Rabbits, Chinchillas, Guinea pigs, Gerbils, Hamsters: Do not use.

*Birds:* 150-200 mg/kg i.v., i.m. q8-12h.

*Reptiles:* No information available.

---

**Timolol maleate** (Timol*, Timoptol*, CoSopt*) POM

**Formulations:** Ophthalmic: 0.25%, 0.5% solutions (0.5% solution most commonly used): 2% dorzolamide with 0.5% timolol (CoSopt).

**Action:** A topical non-selective beta-blocker that decreases aqueous humour production via beta-adrenoreceptor blockade in the ciliary body. See also Dorzolamide.

**Use:** Management of canine and feline glaucoma. It can be used alone or in combination with other topical glaucoma drugs, such as a
topical carbonic anhydrase inhibitor. Dorzolamide-timolol combination can be used in the control of most types of glaucoma in dogs. It may be more effective than either drug alone. The combination causes miosis and is therefore not the drug of choice in uveitis or anterior lens luxation. Although no specific guidelines are available, it may be appropriate to use 0.25% in cats and small dogs <10 kg.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Systemic absorption may occur following topical application causing bradycardia and reduced blood pressure. Avoid in uncontrolled heart failure and asthma.

**Adverse reactions:** Ocular adverse effects include miosis, conjunctival hyperaemia and local irritation.

**Drug interactions:** Additive adverse effects may develop if given concurrently with oral beta-blockers. Concomitant administration of timolol with verapamil may cause a bradycardia and asystole. Prolonged AV conduction times may result if used with calcium antagonists or digoxin.

**DOSES**

**Dogs:** One drop per affected eye q8-12h.

**Cats:** One drop per affected eye q12h.

**Small mammals, Birds, Reptiles:** No information available.

---

**Tobramycin** *(Nebcin*, Tobramycin*) POM

**Formulations:** Injectable: 40 mg/ml solution.

**Action:** Aminoglycosides inhibit bacterial protein synthesis. They are bactericidal and their mechanism of killing is concentration-dependent, leading to a marked post-antibiotic effect, allowing pulse-dosing regimens which may limit toxicity.

**Use:** Treatment of Gram-negative infections. It is less active against most Gram-negative organisms than gentamicin, but appears to be more active against *Pseudomonas aeruginosa*. Aminoglycosides are ineffective at sites of low oxygen tension (e.g. abscesses) and all obligate anaerobic bacteria are resistant. More pharmacokinetic work is necessary to be sure of the dose rate, particularly in cats. The doses below are for general guidance only, and should be assessed according to the clinical response. Cellular casts found in the urine sediment are an early sign of nephrotoxicity. Monitor renal function during use. If giving i.v., administer slowly.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Geriatric animals or those with decreased renal function should only be given this drug systemically when absolutely necessary and then q12h or less frequently. Do not use ophthalmic product where corneal ulceration is present.

**Adverse reactions:** Tobramycin is considered to be less nephrotoxic than gentamicin.
Drug interactions: Avoid concurrent use of other nephrotoxic, ototoxic or neurotoxic agents (e.g. amphotericin B, cisplatin, furosemide). Increase monitoring and adjust dosages when these drugs must be used together. Aminoglycosides may be chemically inactivated by beta-lactam antibiotics (e.g. penicillins, cephalosporins) or heparin when mixed in vitro. The effect of non-depolarizing muscle relaxants (e.g. pancuronium) may be enhanced by aminoglycosides. Synergism may occur when aminoglycosides are used with penicillins or cephalosporins.

DOSES

Dogs, Cats: Systemic: 2-4 mg/kg slow i.v., i.m., s.c. q8-24h. Pulse dosing (q24h) may be more effective (as for gentamicin).

Small mammals: No information available.

Birds: 2.5-5 mg/kg i.m. q8-12h.

Reptiles: 2.5 mg/kg i.m. q24-72h.

Toldimphos see Phosphate

Tolfenamic acid (Tolfedine) POM-V

Formulations: Injectable: 40 mg/ml solution. Oral: 6 mg, 20 mg, 60 mg tablets.

Action: Inhibition of cyclo-oxygenase but uncertain if preferentially inhibits COX-2 over COX-1. COX inhibition limits the production of prostaglandins involved in inflammation. Also reported to have a direct antagonistic action on prostaglandin receptors.

Use: Alleviation of inflammation and pain in dogs and cats. Also used in the management of chronic locomotor disease in dogs and for the management of fever and the treatment of upper respiratory tract disorders, in combination with antibiotics, in cats. Injectable is authorized for preoperative administration to cats and dogs. Liver disease will prolong the metabolism of tolfenamic acid leading to the potential for drug accumulation and overdose with repeated dosing. In the cat, due to the longer half-life and narrower therapeutic index, particular care should be taken not to exceed the recommended dose and the use of a 1 ml graduated syringe is recommended to measure the dose accurately.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not give to dehydrated, hypovolaemic or hypotensive patients or those with Gl disease or blood clotting problems. Use with caution in renal diseases and in the perioperative period, as may adversely affect renal perfusion during periods of hypotension. Do not give to pregnant animals or animals <6 weeks old. Do not give i.m. to cats.
**Adverse reactions:** GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

**Drug interactions:** Do not administer concurrently with, or within 24 hours of, other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

**DOSES**

**Dogs:** 4 mg/kg i.m., s.c., may be repeated once after 24h; 4 mg/kg p.o for 3 days. Treatment starts with a single injection on day 1. The oral dosage regimen may be repeated once a week (i.e. 4 days of treatment with 3 days rest).

**Cats:** 4 mg/kg s.c., may be repeated once after 24h; 4 mg/kg p.o for 3 days. Treatment starts with a single injection on day 1. Repeated dosing on a weekly basis is not recommended in cats.

**Small mammals, Birds, Reptiles:** No information available.

**Tramadol** (Ultram*, Ultracet*, Tramadol ER*, Zamadol*.) POM

**Formulations:** Oral: 50 mg tablets; 100 mg, 200 mg, 300 mg extended release tablets; 5 mg/ml oral liquid. Injectable: 50 mg/ml solution.

**Action:** Agonist properties at all opioid receptors but particularly at OP3 receptors. It also inhibits the reuptake of noradrenaline and 5-HT, and stimulates presynaptic 5-HT release, which provides an alternative pathway for analgesia involving the descending inhibitory pathways within the spinal cord.

**Use:** Management of mild to moderate acute pain. Use as an adjunctive analgesic in the management of chronic pain resulting from osteoarthritis or neoplasia. To date there are no published studies relating the pharmacokinetics of tramadol in cats and dogs to analgesia. Therefore the recommended dose range is currently empirical. When used for chronic pain anecdotal evidence suggests that it is safe to start at the lower end of the dose range and gradually increase the dose until the desired effect is achieved. Perioperatively, injectable tramadol is used instead of opioids to provide analgesia for acute pain. One study has shown tramadol 2 mg/kg to provide equivalent analgesia to morphine 0.2 mg/kg i.v. after ovariohysterectomy in dogs, however there are limited studies investigating its use for perioperative pain. Tramadol has similar actions to morphine but causes less respiratory depression, sedation and GI side effects. It can be a very useful adjunct to manage chronic pain because it can be given orally and is not subject to controlled drug regulations. Cats seem to be more susceptible to the dysphoric effects of tramadol, accurate dosing is important but can be difficult with the oral 50 mg formulation.
Safety and handling: Normal precautions should be observed.

Contraindications: Contraindicated in humans with epilepsy. Owners should be informed that there may be a slightly increased risk of seizures in treated animals.

Adverse reactions: Sedation can occur after administration of high doses to dogs. Dysphoria is more likely in cats.

Drug interactions: Tramadol can be given in combination with other classes of analgesic drugs such as NSAIDs, amantadine, gabapentin and opioids. It has the potential to interact with drugs that inhibit central 5-HT and noradrenaline re-uptake such as tricyclic antidepressants and selective serotonin re-uptake inhibitors, resulting in seizures.

DOSES

Dogs: 2-5 mg/kg p.o. q12h, 2 mg/kg i.v.
Cats: 2-4 mg/kg p.o. q12h, 1-2 mg/kg s.c. once.
Small mammals, Birds, Reptiles: No information available.

Travoprost (Travatan*) POM

Formulations: Ophthalmic: 40 µg/ml (0.004%) solution in 2.5 ml bottle.

Action: Agonist for receptors specific for prostaglandin F. It reduces intraocular pressure by increasing uveoscleral outflow and may have a profound effect on intraocular pressure in the dog.

Use: Its main indication is in the management of primary canine glaucoma and it is useful in the emergency management of acute primary glaucoma (superceding mannitol). There are no published data on its use in the cat but other tested topical PG analogues have been ineffective in this species. Often used in conjunction with other topical antiglaucoma drugs such as carbonic anhydrase inhibitors. It may be useful in the management of lens subluxation despite being contraindicated in anterior lens luxation. Travoprost has comparable activity to latanoprost.

Safety and handling: Normal precautions should be observed.

Contraindications: Uveitis and anterior lens luxation (due to the marked miosis).

Adverse reactions: Miosis in dogs and cats; conjunctival hyperaemia and mild irritation may develop. Increased iridal pigmentation has been noted in humans but not in dogs.

Drug interactions: Do not use in conjunction with thiomersal-containing preparations.

DOSES

Dogs: 1 drop per eye once daily (evening), or q12h.
Cats, Small mammals, Birds, Reptiles: No information available.
Tretinoin see Vitamin A
TRH see Thyrotropin releasing hormone

Triamcinolone (Panolog, Kenalog*) POM, POM-V

Formulations: Injectable: 40 mg/ml (Kenalog) suspension for deep i.m., intra-articular or intraleisional use. Topical: 1 mg/g or 1 mg/ml cream or ointment (Panolog also contains neomycin).

Action: Alters the transcription of DNA, leading to alterations in cellular metabolism which reduces inflammatory response.

Use: Management of inflammatory arthritides and dermatoses. Unsuitable for alternate-day use because of its duration of activity. Has 1.25 times the anti-inflammatory potency of prednisolone.

On a dose basis, 0.8 mg triamcinolone is equivalent to 1 mg prednisolone. It has negligible mineralocorticoid activity. Animals on chronic therapy should be tapered off their steroids when discontinuing the drug.

Safety and handling: Normal precautions should be observed.

Contraindications: Do not use in pregnant animals. Systemic corticosteroids are generally contraindicated in patients with renal disease and diabetes mellitus. Do not use in birds.

Adverse reactions: Prolonged use of glucocorticoids suppresses the hypothalamic-pituitary axis (HPA) and cause adrenal atrophy. Catabolic effects of glucocorticoids lead to weight loss and cutaneous atrophy. Iatrogenic hyperadrenocorticism may develop with chronic use. Vomiting and diarrhoea may be seen in some patients. GI ulceration may develop. Glucocorticoids may increase urine glucose levels and decrease serum T3 and T4 values. Impaired wound healing and delayed recovery from infections may be seen.

Drug interactions: There is an increased risk of GI ulceration if systemic glucocorticoids are used concurrently with NSAIDs. Hypokalaemia may develop if potassium-depleting diuretics (e.g. furosemide, thiazides) are administered with corticosteroids. Insulin requirements may increase in patients taking glucocorticoids. Metabolism of corticosteroids may be enhanced by phenobarbital or phenytoin.

DOSES

Dogs: Systemic: 0.1-0.2 mg/kg i.m. initially then 0.02-0.04 mg/kg maintenance. A single i.m. dose of the long-acting preparations is effective for 3-4 weeks. Intraleisional: 1.2-1.8 mg (total dose) injected intralesionally. Maximum 0.6 mg at any one site; separate injections by 0.5-2.5 cm. Topical: Apply small amount to affected area q6-8h.

Birds: Do not use.

Small mammals, Reptiles: No information available.
**Trientine (2,2,2-Tetramine) (Trientine*) POM**

**Formulations:** Oral: 300 mg capsule.

**Action:** Trientine is a copper chelator used to aid the urinary elimination of copper. It is slower acting than its analogue 2,3,2-tetramine but this is not commercially available.

**Use:** Treatment of dogs with copper hepatotoxicosis, especially those intolerant of penicillamine. Vomiting may be reduced by giving in divided doses with food.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Nausea, vomiting, abdominal pain, melaena and weakness. Chronic therapy can, rarely, lead to copper deficiency.

**Drug interactions:** No information available.

**DOSES**

- **Dogs:** 10-15 mg/kg p.o. q12h.
- **Cats, Small mammals, Birds, Reptiles:** No information available.

---

**Trifluorothymidine (Trifluridine, F3T) (Viroptic* (USA)) POM**

**Formulations:** Ophthalmic: 1% solution in 10 ml bottle (with/without preservative depending on availability from compounding pharmacy).

**Action:** Inhibits viral replication (viral DNA polymerase); does not depend on viral thymidine kinase for phosphorylation.

**Use:** Clinically the most effective antiviral available for feline herpesvirus infection. Usually reserved for corneal ulceration due to herpetic disease. It is safe to combine with topical interferon solution and is available in the UK if compounded by an ophthalmic pharmacy (e.g. Moorfields Eye Hospital, London). It has a short shelf-life of 12 weeks from the manufacturer, even unopened, and is expensive. Trifluorothymidine is viristatic and is unable to eradicate latent viral infection. In refractory and severe cases, combined therapy including topical antiviral medication, human recombinant IFN-alpha and oral lysine, can be used. Treatment should not be continued for more than 3 weeks.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Ocular irritation may occur; frequency of application should be reduced if this develops.

**Drug interactions:** No information available.

**DOSES**

- **Cats:** 1 drop per eye q4-6h for a maximum of 3 weeks. More frequent application q1-2h for acute infection is safe if tolerated.
- **Dogs, Small mammals, Birds, Reptiles:** No information available.
**L-Tri-iodothyronine** see Liothyronine

**Trilostane** (Vetoryl) POM-V

**Formulations:** Oral: 10 mg, 30 mg, 60 mg, 120 mg capsules.

**Action:** Blocks adrenal synthesis of glucocorticoids, mineralocorticoids and sex hormones such as testosterone and oestradiol.

**Use:** Treatment of canine pituitary- and adrenal-dependent hyperadrenocorticism. It has been reported to be useful in the treatment of feline hyperadrenocorticism and canine ‘alopecia X’ syndrome. It is not considered to be useful in treating ferrets with hyperadrenocorticism. Perform ACTH stimulation tests (start test 3-5h post-dosing) 10 days, 4 weeks, 12 weeks and then every 3 months. The aim is for a post-ACTH cortisol of <150 nmol/l. In cases where clinical signs persist or polydipsia appears within the 24-hour period, ACTH stimulation tests performed later in the day and/or sequential cortisol determinations may be needed for dose adjustment (either mg/kg or frequency). Dosage adjustments may be necessary even after prolonged periods of stability. A month gap between ceasing mitotane and commencing trilostane is suggested. If switching from trilostane to mitotane, then post-ACTH cortisol concentrations should be >200 nmol/l before starting mitotane.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Renal and hepatic insufficiency should be excluded before commencing therapy.

**Adverse reactions:** In humans, idiosyncratic reactions include diarrhoea, colic, muscle pain, nausea, hypersalivation and rare cases of skin changes (rash or pigmentation). Reported adverse effects in dogs include mild increases in serum potassium, bilirubin and calcium. Clinical hypoadrenocorticism can be seen. Adrenal necrosis has been reported. Adrenal hyperplasia has been noted with prolonged treatment but the effects of this are unknown. Prolonged adrenal suppression after drug withdrawal has been noted in some cases.

**Drug interactions:** Trilostane should not be administered concurrently with other drugs that suppress adrenal function, e.g. mitotane, ketoconazole.

**DOSES**

**Dogs:** 2-12 mg/kg p.o. once daily. Start at the low end of the range and increase gradually.

**Cats:** 30 mg/cat p.o. q24h, adjusting dose according to clinical signs and post-treatment ACTH stimulation tests. Very few cats have been treated with trilostane.

**Small mammals, Birds, Reptiles:** No information available.
Trimethoprim/Sulphonamide (Potentiated sulphonamides) (Chanoprim, Duphatrim, Tribrissen, Trimacare, Trimedoxine, Trinacol) POM-V

Formulations: Trimethoprim and sulphonamide are formulated in a ratio of 1:5. Injectable: trimethoprim 40 mg/ml and sulfadiazine 200 mg/ml (240 mg/ml total) suspension. Oral: trimethoprim and sulfadiazine in a variety of tablet sizes designated by the amount of trimethoprim e.g. 20 mg, 80 mg.

Action: Trimethoprim and sulphonamides block sequential steps in the synthesis of tetrahydrofolate, a cofactor required for the synthesis of many molecules, including nucleic acids. Sulphonamides block the synthesis of dihydropteroic acid by competing with para-aminobenzoic acid, and trimethoprim inhibits the enzyme dihydrofolate reductase, preventing the reduction of dihydrofolic acid to tetrahydrofolic acid. This two-step mechanism ensures that bacterial resistance develops more slowly than to either agent alone. In addition the effect of the combination tends to be bactericidal as against a bacteriostatic effect of either agent alone.

Use: Many organisms are susceptible, including Nocardia, Brucella, Gram-negative bacilli, some Gram-positive organisms (Streptococcus spp.), plus Pneumocystis carinii, Toxoplasma gondii and other coccidians. Pseudomonas spp. and Leptospira spp. are usually resistant. Trimethoprim/sulphonamide is useful in the management of urinary, respiratory tract and prostatic infections, but ineffective in the presence of necrotic tissue. Trimethoprim alone may be used for urinary, prostatic, systemic salmonellosis and respiratory tract infections. Fewer adverse effects are seen with trimethoprim alone. Trimethoprim is a weak base which becomes ion-trapped in fluids that are more acidic than plasma (e.g. prostatic fluid and milk). Monitor tear production particularly during long-term use and in breeds susceptible to keratoconjunctivitis sicca. Ensure patients receiving sulphonamides are well hydrated and are not receiving urinary acidifying agents.

Safety and handling: Normal precautions should be observed.

Contraindications: Avoid use in animals with keratoconjunctivitis sicca (KCS) or previous history of adverse reaction to sulphonamides such as KCS or polyarthritis. Beware use in reptiles where renal disease is suspected.

Adverse reactions: Drowsiness, anorexia, leucopenia, anaemia and hypersalivation may be seen in cats. Acute hepatitis, vomiting, cholestasis, immune-mediated thrombocytopenia and an immune-mediated polyarthritis may be seen in dogs. Acute hypersensitivity reactions are possible with sulphonamide products; they may manifest as a type III hypersensitivity reaction. Haematological effects (anaemias, agranulocytosis) are possible but rare in dogs. Sulphonamides may reversibly suppress thyroid function. Dermatological reactions (e.g. toxic epidermal necrolysis) have been associated with the use of sulphonamides in some animals. KCS has been reported in dogs treated with sulfapyridine and other sulphonamides. Sulphonamide crystal formation can occur in the
urinary tract, particularly in animals producing very concentrated acidic urine.

**Drug interactions:** The anticoagulant effect of warfarin may be enhanced by trimethoprim/sulphonamide. Antacids may decrease the bioavailability of sulphonamides if administered concomitantly. Urinary acidifying agents will increase the tendency for sulphonamide crystals to form within the urinary tract. Concomitant use of drugs containing procaine may inhibit the action of sulphonamides since procaine is a precursor for para-amino benzoic acid. When using the Jaffe alkaline picrate reaction assay for creatinine determination, trimethoprim/sulphonamide may cause an over-estimation of approximately 10%.

**DOSES**

Doses (mg) of total product (trimethoprim + sulphonamide)

**Dogs, Cats:** 15 mg/kg p.o. q12h. (Trimethoprim alone: 4-5 mg/kg p.o. q12h.)

**Small mammals:** Ferrets: 15-30 mg/kg p.o., s.c. q12h; Rabbits: trimethoprim-sulfadiazine 30 mg/kg p.o., s.c.q24h; trimethoprim-sulfamethoxazole 40 mg/kg p.o. q24h; Chinchillas, Guinea pigs, Hamsters: 15-30 mg/kg p.o. i.m., s.c q12-24h; Gerbils, Rats, Mice: 50-100 mg/kg p.o. s.c. q24h.

**Birds:** 8-30 mg/kg i.m. q12h; 20-100 mg/kg p.o. q12h; pigeons: 475-970 mg/l drinking water.

**Reptiles:** coccidiosis: 25 mg/kg p.o. q 24h for 21 days.

**Tropicamide** (Mydriacyl*, Tropicamide*) POM

**Formulations:** Ophthalmic: 0.5%, 1% solution, single-use vials.

**Action:** Inhibits acetylcholine at the iris sphincter and ciliary body muscles, causing mydriasis (dilates pupil) and cycloplegia (paralysis of the ciliary muscle).

**Use:** Synthetic, short-acting antimuscarinic used for mydriasis and cycloplegia. It is the mydriatic of choice for intraocular examination due to its rapid onset (20-30 min) and short duration of action of (4-12 h). Tropicamide is a more potent mydriatic than cycloplegic and is therefore less effective (than atropine for example), in relieving ciliary body muscle spasm associated with uveitis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Avoid in glaucoma and use with care in lens luxation.

**Adverse reactions:** May cause salivation in cats, but less marked than with atropine.

**Drug interactions:** No information available.

**DOSES**

**Dogs, Cats:** 1 drop per eye, repeat after 20-30 min if necessary.

**Small mammals, Birds, Reptiles:** No information available.
**TSH** see Thyroid stimulating hormone

**Tylosin** (Bilosin, Tylan, Tyluvet) POM-V

**Formulations:** Injectable: 200 mg/ml solutions (Bilosin, Tylan, Tyluvet). Oral: 100 g/bottle soluble powder (Tylan).

**Action:** A bacteriostatic macrolide antibiotic that binds to the 50S ribosomal subunit, suppressing bacterial protein synthesis.

**Use:** Tylosin has good activity against mycoplasmas and has the same antibacterial spectrum of activity as erythromycin but is generally less active against bacteria. Although rarely indicated in small animal medicine, it has been used for the treatment of antibiotic-responsive diarrhoea in dogs and for cryptosporidiosis.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not give to hamsters, guinea pigs or rabbits.

**Adverse reactions:** GI disturbances. The activity of tylosin is enhanced in an alkaline pH. Tylosin can cause pain at the site of injection.

**Drug interactions:** Not well documented in small animals. It does not appear to inhibit the same hepatic enzymes as erythromycin.

**DOSES**

**Dogs, Cats:** 2-10 mg/kg i.m. q24h, 7-11 mg/kg p.o. q6-8h. May need higher dosages for dogs with chronic colitis and in the treatment of cryptosporidiosis.

**Small mammals:** Ferrets, Rats, Mice, Chinchillas: 10 mg/kg p.o., i.m., s.c. q12h. Not recommended for Hamsters, Guinea pigs or Rabbits.

**Birds:** 20-40 mg/kg i.m. q8-12h, or by nebulization of 100 mg diluted in 5 ml DMSO and 10 ml saline; Passerines: 1 g/l drinking water for 7-10 days; Pigeons: 50 mg/kg p.o. q24h, 25mg/kg i.m. q6-8h, or 800 mg/l drinking water.

**Reptiles:** 5 mg/kg i.m. q24h q10-60d.

**Ursodeoxycholic acid** (Destolit*, Urdox*, Ursodeoxycholic acid*, Ursofalk*) POM

**Formulations:** Oral: 150 mg, 300 mg tablets; 250 mg capsule; 50 mg/ml suspension.

**Action:** A relatively hydrophilic bile acid with cytoprotective effects in the biliary system. It inhibits ileal absorption of hydrophobic bile acids, thereby reducing their concentration in the body pool; hydrophobic bile acids are toxic to hepatobiliary cell membranes and may potentiate cholestasis. It also has an immunomodulatory effect, and may modify apoptosis of hepatocytes.

**Use:** Cholestatic liver disease. The administration of UDCA does not alter the bile acids tolerance test of normal healthy dogs but a small but significant increase has been demonstrated in cats. In animals
with liver disease, bile acid concentrations would be expected to fall with successful therapy.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** No information available.

**Adverse reactions:** Vomiting is a rare effect. Safety has been demonstrated in cats. Serious hepatotoxicity has been recognized in rabbits and non-human primates, but not in dogs or cats.

**Drug interactions:** No information available.

**DOSES**

*Dogs, Cats:* 10-15 mg/kg p.o. q24h  
*Small mammals, Birds, Reptiles:* No information available.

---

**Vasopressin (ADH) (Pitressin*) POM**

**Formulations:** Injectable, topical: 20 IU/ml of argipressin (synthetic vasopressin) in aqueous solution.  

**Action:** Posterior pituitary hormone with vasopressive and antidiuretic properties.  

**Use:** Diagnosis and treatment of central diabetes insipidus. Desmopressin is generally preferred and is better researched.  

**Safety and handling:** Normal precautions should be observed.  

**Contraindications:** Do not use if cardiac disease is present.  

**Adverse reactions:** Nausea, muscle cramp, hypersensitivity reactions and constriction of myocardial arteries are seen in humans.  

**Drug interactions:** No information available.

**DOSES**

*Dogs, Cats:* 0.5 IU/kg i.m., s.c. prn; maximum dose 5 IU.  
*Small mammals, Birds, Reptiles:* No information available.

---

**Vecuronium (Norcuron*) POM**

**Formulations:** Injectable: 10 mg powder for reconstitution.  

**Action:** Inhibits the actions of acetylcholine at the neuromuscular junction by binding competitively to the alpha subunit of the nicotinic acetylcholine receptor on the post-junctional membrane.  

**Use:** Provision of neuromuscular blockade during anaesthesia. This may be to improve surgical access through muscle relaxation, to facilitate positive pressure ventilation or for intraocular surgery. Intermediate dose-dependent duration of action of approximately 20-30 min. Has no cardiovascular effects and does not cause histamine release. Monitoring (using a nerve stimulator) and reversal of the neuromuscular blockade are recommended to ensure complete recovery before the end of anaesthesia. Hypothermia, acidosis and hypokalaemia will prolong the duration of neuromuscular blockade. In healthy animals repeated doses are relatively non-cumulative and it
can be given by infusion i.v. to maintain neuromuscular blockade. It is metabolized by the liver; therefore atracurium is advised in animals with liver dysfunction. Used topically as a mydriatic in birds; ensure solution does not contain surface-penetrating agent.

**Safety and handling:** Unstable in solution and so is presented as a freeze-dried powder. The prepared solution can be diluted further if required.

**Contraindications:** Do not administer unless the animal is adequately anaesthetized and facilities to provide positive pressure ventilation are available.

**Adverse reactions:** No information available

**Drug interactions:** Neuromuscular blockade is more prolonged when vecuronium is given in combination with volatile anaesthetics, aminoglycosides, clindamycin and lincomycin.

**DOSES**

**Dogs, Cats:** 0.1 mg/kg initially produces neuromuscular blockade for 25-30 min. The block can be maintained by increments of 0.03 mg/kg or a constant rate infusion of 0.1-0.2 mg/kg/h. Lower loading doses of 0.05 mg/kg i.v. produce neuromuscular blockade of shorter duration (16-19 min).

**Birds:** 1 drop of 0.8 mg/ml solution in 0.9% saline applied topically to eye; repeat after 2 minutes.

**Small mammals, Reptiles:** No information available.

**Vedaprofen** (Quadrisol) POM-V

**Formulations:** Oral: 5 mg/ml, 1 mg/ml gel in ‘dial a dose’ syringes.

**Action:** Vedaprofen is an NSAID that preferentially inhibits COX-2 enzyme in some testing systems, thereby limiting the production of prostaglandins involved in inflammation.

**Use:** Relief of pain and control of inflammation associated with acute and chronic musculoskeletal disorders and trauma in dogs. The gel may be administered directly into the mouth or mixed with food. The less concentrated gel is indicated for use in dogs <10 kg. In some countries (not UK) is authorized for the control of fever and pain in cats. Vedaprofen is an oral preparation and is not authorized for preoperative administration to dogs. Vedaprofen is authorized for use during pregnancy in dogs. Liver disease will prolong the metabolism of vedaprofen, leading to the potential for drug accumulation and overdose with repeated dosing.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not give to dehydrated, hypovolaemic or hypotensive patients or those with GI disease or blood clotting problems. Do not administer perioperatively until the animal is fully recovered from anaesthesia and normotensive. Administration of vedaprofen to animals with renal disease must be carefully evaluated. Do not use in animals <12 weeks.
Adverse reactions: GI signs may occur in all animals after NSAID administration. Stop therapy if this persists beyond 1-2 days. Some animals develop signs with one NSAID drug and not another. A 1-2-week wash-out period should be allowed before starting another NSAID after cessation of therapy. Stop therapy immediately if GI bleeding is suspected. There is a small risk that NSAIDs may precipitate cardiac failure in animals with cardiovascular disease.

Drug interactions: Do not administer concurrently with, or within 24 hours of, other NSAIDs and glucocorticoids. Do not administer with other potentially nephrotoxic agents, e.g. aminoglycosides.

DOSES
Dogs: 0.5 mg/kg q24h using the formulation appropriate to the size of the animal.
Cats: Do not use.
Small mammals, Birds, Reptiles: No information available.

Verapamil (Cordilox*, Securon*, Verapamil*) POM
Formulations: Injectable: 2.5 mg/ml solution. Oral: 40 mg, 80 mg, 120 mg, 160 mg tablets.
Action: Interferes with the inward movement of calcium ions through the slow channels in myocardial cells, cells within the specialized conduction system in the heart and vascular smooth muscle. Systemic resistance vessels and large arteries respond to calcium-channel blockers more readily than venous capacitance vessels and pulmonary vasculature. Verapamil causes a reduction in myocardial contractility (negative inotrope), depressed electrical activity (retards AV conduction) and vasodilation (cardiac vessels and peripheral arteries and arterioles).

Use: Primarily used to control supraventricular tachyarrhythmias. Also used for heart rate control in dogs with atrial fibrillation as an adjunct to digoxin and in the management of hypertension. In rabbits can be used perioperatively to minimize formation of surgical adhesions. Verapamil is a second-choice calcium-channel blocker behind diltiazem as it has a more pronounced negative inotropic effect. It is less effective in controlling hypertension compared to amlodipine.

Safety and handling: Normal precautions should be observed.
Contraindications: Do not use in patients with 2nd or 3rd degree heart block, hypotension, sick-sinus syndrome, severe left ventricular dysfunction or heart failure. Patients with severe hepatic disease may have a reduced ability to metabolize the drug; reduce the dose by 70%.

Adverse reactions: Can cause hypotension, bradycardia, tachycardia, dizziness, exacerbation of congestive heart failure, nausea, constipation and fatigue in humans.
Drug interactions: Great care is needed if using beta-blockers simultaneously. Both drugs can have a negative inotropic and chronotropic effect and the combined effect can be profound. Co-administration with lidocaine may also lead to marked cardiovascular depression and hypotension. Verapamil activity may be adversely affected by Vitamin D or calcium salts. Cimetidine may increase the effects of verapamil. Verapamil may increase the blood levels of digoxin, digitoxin, warfarin or theophylline, leading to potentially toxic effects from these drugs. Calcium-channel blockers may increase intracellular vincristine. The neuromuscular blocking effects of nondepolarizing muscle relaxants may be enhanced by verapamil. Quinidine effects may be altered and hypotension may occur in patients also receiving verapamil.

DOSES

**Dogs:** 0.5-3 mg/kg p.o. q8h or 0.05 mg/kg slowly i.v. over 10 min (with ECG monitoring). Up to 4 repeat i.v. administrations at a reduced dose of 0.025 mg/kg q5min if necessary.

**Cats:** 0.5-1 mg/kg p.o. q8h or 0.025 mg/kg slowly i.v. over 5 min (with ECG monitoring). Up to 8 repeat i.v. administrations q5min if necessary.

**Small mammals:** Rabbits: 0.2 mg/kg slow i.v., p.o. after surgery and repeated q8h for 9 doses) or 2.5-25 µg/kg/h i.p., s.c.; Hamsters: 0.25-0.5 mg/kg s.c. q12h.

**Birds, Reptiles:** No information available.

Vetrabutine (Monzaldon) POM-V

**Formulations:** Injectable: 100 mg/ml solution.

**Action:** A chemical derivative of papaverine, an opium alkaloid that has a different chemical structure and pharmacological action from the opiates and which is used as a spasmolytic agent.

**Use:** Dilation of the cervix and coordination of the uterine contractions to ease and shorten parturition. May be useful in dystocia where there is insufficient relaxation of the birth canal.

**Safety and handling:** Pregnant women should preferably not handle this drug; if they must do so, then great care must be exercised to avoid self-injection.

**Contraindications:** Do not use in cats.

**Adverse reactions:** No information available

**Drug interactions:** No information available.

**DOSES**

**Dogs:** 2 mg/kg i.m. q30-60 min up to 3 times.

**Cats:** Do not use.

**Small mammals, Birds, Reptiles:** No information available.
**Vinblastine** (Velbe*, Vinblastine*) POM

**Formulations:** Injectable: 1 mg/ml solution.

**Action:** Interferes with microtubule assembly, causing metaphase arrest and ultimately resulting in cell death.

**Use:** In veterinary medicine vinblastine is used less frequently than vincristine for treatment of lymphoproliferative disorders, but it has been used with prednisolone for treatment of high-grade canine mast cell tumours. See Appendix for conversion of bodyweight to surface area.

**Safety and handling:** Disposable gloves should be worn to handle and administer. Drug is locally irritant and must be administered i.v. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

**Contraindications:** Bone marrow suppression. Use with care in patients with abnormal liver function, dose reduction recommended.

**Adverse reactions:** Main dose-limiting toxicity is myelosuppression with neutropenia. Mucositis, stomatitis and GI tract toxicity may also occur.

**Drug interactions:** Any drugs that inhibit metabolism via hepatic cytochrome P450 system may reduce metabolism and thus increase toxicity of vinblastine, e.g. calcium-channel blockers, cimetidine, ciclosporin, erythromycin, metoclopramide, ketoconazole.

**DOSES**

**Dogs, Cats:** 2.0-2.5 mg/m² q7-14d.

**Small mammals, Birds, Reptiles:** No information available.

**Vincristine** (Vincristine*, Oncovin*) POM

**Formulations:** Injectable: 1 mg, 2 mg, 5 mg vials.

**Action:** Interferes with microtubule assembly, causing metaphase arrest and ultimately resulting in cell death.

**Use:** With other neoplastic agents in the treatment of canine and feline neoplastic diseases, particularly lymphoproliferative disorders. May be used in the management of thrombocytopenia to stimulate release of platelets. See Appendix for conversion of body weight to surface area.

**Safety and handling:** Disposable gloves should be worn to handle or administer. Wash off from exposed skin with large volumes of water. Solution is locally irritant and must be administered i.v. Staff and clients should be warned that excreta (including saliva) may contain traces of the parent drug or its metabolites, and should be handled with due care.

**Contraindications:** No information available.
**Adverse reactions:** Include peripheral neuropathy, constipation and severe local irritation if administered perivascularly.

**Drug interactions:** Concurrent administration of vincristine with drugs that inhibit cytochromes of the CYP3A family may result in decreased metabolism of vincristine and increased toxicity. If vincristine is used in combination with crisantaspase (asparaginase) it should be given 12-24 hours before the enzyme. Administration of crisantaspase with or before vincristine may reduce clearance of vincristine and increase toxicity.

**DOSES**

**Dogs, Cats:**
- Transmissible venereal tumours: 0.025 mg/kg i.v. q7d for 4 weeks.
- Other neoplastic diseases: usual doses are 0.5-0.75 mg/m². See Lymphoma chemotherapy protocols in Appendix.
- To increase circulating platelet numbers: 0.01-0.025 mg/kg i.v. q7d prn.

**Small mammals:** Ferrets: 0.025 mg/kg i.v. as part of chemotherapy protocol for lymphoma.

**Birds, Reptiles:** No information available.

**Vitamin A** *(Retinol, Isotretinoin, Tretinoin)* *(Dupharal ADE Forte, Isotrexin*, Roaccutane*)

**Formulations:** Injectable: Vitamin A (retinol) 50,000 IU/ml. Oral: 5 mg isotretinoin capsules (Roaccutane). Topical: 0.05% isotretinoin gel (Isotrexin); 0.025% tretinoin cream; 0.01% tretinoin gel (Retin-A).

**Action:** Nutritional fat-soluble hormone that regulates gene expression. Tretinoin (all-trans retinoic acid) is the acid form of vitamin A and isotretinoin (13-cis retinoic acid) is an isomer of tretinoin.

**Use:** Treatment of hypovitaminosis A. Also used in conjunction with other appropriate therapies for sebaceous adenitis or primary seborrhoea of Cocker Spaniels. Animals receiving oral dosing should be monitored for vitamin A toxicity. Avoid concurrent use of oral and topical preparations because of toxicity.

**Safety and handling:** Vitamin A is teratogenic; gloves should be worn when applying topical preparations. Avoid contact with eyes, mouth or mucous membranes. Minimize exposure of the drug to sunlight.

**Contraindications:** Do not use in pregnant animals. Do not use topical preparations simultaneously with other topical drugs.

**Adverse reactions:** Many adverse effects are reported in humans following the use of oral isotretinoin, predominantly involving the skin, haematological parameters, hepatotoxicity, nervous system and bone changes. Similar abnormalities are reported in dogs and cats receiving high doses. Teratogenic if administered in the first trimester.
or at high doses. Redness and skin pigmentation may be seen after several days. It changes the lipid content of tears, may cause hyperlipidaemia and can be hepatotoxic. Prolonged use of vitamin A can promote loss of calcium from bone and lead to hypercalcaemia.

**Drug interactions:** Numerous, depending on preparation and route given. Consult specialist tests before using with another drug. Oral vitamin A may alter ciclosporin levels, which should therefore be monitored closely.

**DOSES**

**Dogs:**
- Hypovitaminosis A: 10,000-100,000 IU i.m. q3d, no more than two doses; 10,000 IU p.o. q24h for 3 days.
- Dermatological: 10,000 IU q24h p.o. or apply isotretinoin/tretinoin gel/cream to clean skin q12h; 1 mg isotretinoin/kg p.o. q12h for 1 month, reducing the dosage to 1 mg/kg p.o. q24h if improvement is seen.

**Cats:** Hypovitaminosis A: 10,000-100,000 IU i.m. q3d, no more than two doses; 10,000 IU p.o. q24h for 3 days.

**Small mammals:** Rabbits: 500-1000 IU/kg i.m. once; Guinea pigs: 50-500 IU/kg i.m. or 10 mg beta carotene/kg food; Hamsters: 50-500 IU/kg i.m. or 2 µg vitamin A palmitate/g food.

**Birds:** 1000-20,000 IU i.m. once or p.o. q12h.

**Reptiles:** 1000-20,000 IU/kg p.o. q7-14d.

**Vitamin B Complex** (Anivit 4BC, Dupharal, Multivitamin injection, Vitamin B tablets) POM-VPS, GSL

**Formulations:** Various preparations containing varying quantities of vitamins are available, authorized for farm animals only. Most are for parenteral use and all those are POM-VPS.

**Action:** Cofactors for enzymes of intermediary metabolism and biosynthesis.

**Use:** Multiple deficiencies of B vitamins may occur in patients with renal or hepatic disease or significant anorexia. Dosages and routes vary with individual products. Check manufacturer’s recommendations prior to use. Most products are intended for large animal use and some may contain vitamin C and other vitamins or minerals.

**Safety and handling:** All B vitamins are photosensitive and must be protected from light. Multi-dose vials require aseptic technique for repeated use.

**Contraindications:** No information available.

**Adverse reactions:** Anaphylaxis may be seen when used i.v. and products should be given slowly and/or diluted with i.v. fluids. Use of large animal products which also contain fat-soluble vitamins (A, D, E, K) may lead to toxicity.
Drug interactions: None reported.

DOSES

**Dogs:** 1 ml (dogs up to 15 kg), 2-4 ml s.c., i.m., i.v. (>15 kg) q24h.

**Cats:** 1 ml s.c., i.m., i.v. q24h or as required.

**Small mammals:** Rodents: 0.02-0.2 ml/kg s.c., i.m. q24h or as required.

**Birds:** 1-3 mg/kg i.m. once.

**Reptiles:** No information available.

---

**Vitamin B1** *(Thiamine)* (Vitamin B1) POM-V, GSL

**Formulations:** Injectable: 100 mg/ml solution (authorized for veterinary use, though only in farm animals). Oral: various.

**Action:** Cofactor for enzymes in carbohydrate metabolism, it forms a compound with ATP to form thiamine diphosphate/thiamine pyrophosphate employed in carbohydrate metabolism. It does not affect blood glucose.

**Use:** Thiamine supplementation is required in deficient animals. Although uncommon this may occur in animals fed raw fish diets or uncooked soy products. Thiamine may be beneficial in alleviating signs of lead poisoning and ethylene glycol intoxication. It is used in birds and reptiles for the treatment of cerebral cortical necrosis.

**Safety and handling:** Protect from air and light; multi-dose vials require aseptic technique for repeated use.

**Contraindications:** Use with caution if at all in pregnant animals.

**Adverse reactions:** Anaphylaxis can be seen with i.v. use; dilute with fluids and/or give slowly if using i.v. Adverse effects in pregnant animals are documented.

**Drug interactions:** There are no specific clinical interactions reported, although thiamine may enhance the activity of neuromuscular blocking agents.

**DOSES**

**Dogs:**
- Vitamin B1 deficiency: 50-250 mg/dog i.m., s.c., p.o. q12-24h for several days until signs resolve.
- Lead poisoning: 2 mg/kg i.m., s.c. q12h.
- Ethylene glycol intoxication: 100 mg i.m., s.c., p.o q24h.

**Cats:** Vitamin B1 deficiency: 10-25 mg/cat i.m., s.c. q12-24h for several days until signs resolve or 10-20 mg/kg i.m. until signs resolve then 10 mg/kg p.o. for 21 days.

**Small mammals:** No information available.

**Birds:** 10-30 mg/kg i.m. q24h.

**Reptiles:** Thiamine deficiency: 25-35 mg/kg p.o., i.m., s.c. q24h; Diet high in thiaminases: 30 g/kg of food fed q24h.
Vitamin B3 see Nicotinamide

**Vitamin B12** (Cyanocobalamin, Hydroxocobalamin) (Anivit B12 250 and 1000, Vitbee 250 and 1000, Neo-Cytamen (hydroxocobalamin)) POM-VPS

**Formulations:** Injectable: 0.25 mg/ml, 1 mg/ml solutions.

**Action:** Essential cofactor for enzymes involved in DNA and RNA synthesis and in carbohydrate metabolism.

**Use:** Cyanocobalamin is used to treat vitamin B12 deficiency. Such a deficiency may develop in patients with significant damage to the distal ileum, small intestinal bacterial overgrowth (SIBO), and exocrine pancreatic insufficiency. In humans hydroxocobalamin has almost completely replaced cyanocobalamin as the form of vitamin B12 choice for therapy; hydroxocobalamin is retained longer in the body and thus for maintenance therapy needs only be administered at 3 monthly intervals. Information as to its use in dogs and cats is lacking. Duration of therapy is dependent on specific diagnosis and if reversible small intestinal disease is present therapy may be discontinued.

**Safety and handling:** Must be protected from light.

**Contraindications:** Do not give i.v.

**Adverse reactions:** Hypersensitivity to the phenol preservative in the injectable solutions can occur; patients should be monitored after injections for rash, fever and urticaria.

**Drug interactions:** None reported.

**DOSES**

**Dogs:** 0.25-1 mg s.c., i.m. q7d for 4 weeks, then as needed to maintain normal levels.

**Cats:** 0.125-0.25 mg s.c., i.m. q7d for 4-6 weeks, then as needed to maintain normal levels.

**Small mammals**

**Birds:** No information available.

**Reptiles:** 0.05 mg/kg i.m., s.c.

**Vitamin C** (Ascorbic acid) (numerous trade names) POM, GSL

**Formulations:** Injectable: 100 mg/ml. Oral: Various tablet strengths.

**Action:** Water-soluble antioxidant, also critical for crosslinking collagen precursors (growth and repair of tissue) and is involved in protein, lipid and carbohydrate metabolism.

**Use:** Vitamin C is used to reduce methaemoglobinaemia associated with acetaminophen (paracetamol) toxicity. Supplemental vitamin C may be required in conditions of increased oxidative stress, in cachectic patients and in those requiring nutritional support. There is no evidence to support long-term or high-dose therapy in dogs and cats, as they are able to synthesize vitamin C de novo to meet their needs.
Safety and handling: Normal precautions should be observed.

Contraindications: Prolonged use can increase the risk of urate, oxalate and cystine crystalluria and stone formation.

Adverse reactions: May cause anaphylaxis if given i.v.

Drug interactions: Large doses (oral or injectable) will acidify the urine and may increase the renal excretion of some drugs (e.g. mexilitine) and reduce the effect of some antibacterial drugs in the genito-urinary system (e.g. aminoglycosides).

DOSES

Dogs, Cats: Methaemoglobinemia: 30-40 mg/kg s.c. q6h for 7 treatments.

Small mammals:
- Rabbits: 50-100 mg/kg q12h
- Guinea pigs:
  - maintenance: 10-30 mg/kg/day or 200-400 mg/l drinking water
  - hypovitaminosis C: 100-200 mg/kg p.o. q24h

Birds: No information available.

Reptiles: 10-20 mg/kg i.m. q7d; has been used at 100-250 mg/kg p.o. q24h in cases of infectious stomatitis in association with antimicrobial therapy.

Vitamin D (1,25-dihydroxycolecalciferol (active Vitamin D3), colecalciferol (vitamin D3)) (Calcitriol*, Calcijex*, Rocaltrol*, Alfacalcidol*) POM-VPS, POM

Formulations: Oral: Alfacalcidol 2 µg/ml solution (One-alpha), 0.25-1 µg capsules (Alfacalcidol; One-alpha), Calcitriol 0.25 µg capsules (Calcitriol; Rocaltrol), Dihydrotachysterol 0.25 mg/ml solution (AT 10).
- Injectable: Calcitriol 1 µg/ml solution (Calcijex).

Action: In conjunction with other hormones (calcitonin and parathormone) regulates calcium homeostasis through numerous complex mechanisms, including accretion of calcium to bone stores, absorption of calcium from dietary sources.

Use: Chronic management of hypocalcaemia when associated with low parathyroid hormone concentrations. Calcitriol has been used in the management of renal secondary hyperparathyroidism; in this circumstance it reduces serum parathyroid hormone concentrations. Vitamin D is a general term used to describe a range of hormones that influence calcium and phosphorus metabolism. They include vitamin D2 (ergocalciferol or calciferol), vitamin D3 (colecalciferol), dihydrotachysterol, alfacalcidol and calcitriol (1,25-dihydroxycolecalciferol, the active form of vitamin D3). These different drugs have differing rates of onset and durations of action. Vitamin D2 (ergocalciferol) has a very slow onset of action and has limited use in dogs and cats. Dihydrotachysterol has an onset of action within 24 hours and raises serum calcium within 1-7 days, with a discontinuation time of 1-3 weeks for serum calcium levels to normalize. Calcitriol and alfacalcidol (1-alpha-hydroxycolecalciferol) have a rapid onset of
action (1-2 days) and a short half-life (<1 day); they are the preferred forms for use. Vitamin D requires two hydroxylations to become active, the first occurs in the liver to produce 1-alpha-hydroxy-vitamin D₃ and a final hydroxylation by the kidney to its active form 1,25-dihydroxy-vitamin D₃ or 1,25-dihydroxycolecalciferol. Thus the active form (calcitriol) should be used in patients with renal failure. Vitamin D is used to control hypocalcaemia associated with chronic renal failure, hypoparathyroidism or following thyroidectomy. Vitamin D has a very narrow therapeutic index and toxic doses are easily achieved. Serum calcium and preferably ionized calcium concentrations need to be monitored closely and frequently.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in patients with hyperphosphatasaemia or malabsorption syndromes or that are pregnant.

**Adverse reactions:** Hypercalcaemia, hyperphosphataemia.

**Drug interactions:** Corticosteroids negate the effect of vitamin D preparations. Sucralfate decreases absorption of vitamin D. Drugs that induce hepatic enzyme systems (e.g. barbiturates) will increase the metabolism of vitamin D and lower its effective dose. Magnesium or calcium containing antacids may cause hypermagnesaemia or hypercalcaemia when used with vitamin D. Thiazide diuretics may also cause hypercalcaemia with concurrent use. Hypercalcaemia may potentiate the toxic effects of verapamil or digoxin; monitor carefully.

**DOSES**

**Dogs:**

- Hypocalcaemia/vitamin D deficiency: dihydrotachysterol: 0.02-0.03 mg/kg p.o. q24h initially, then 0.01-0.02 mg/kg p.o. q24-48h for maintenance; calcitriol: 10-15 ng/kg p.o. q12h for 3-4 days, then decrease to 2.5-7.5 ng/kg p.o. q12h for 2-3 days then give q24h.
- Renal secondary hyperparathyroidism: calcitriol: 1.5 to 3.5 ng/kg p.o. q24h; some authors recommend higher doses of up to 6 ng/kg/day if there is refractory hyperparathyroidism and ionized serum calcium concentrations can be assessed. Assess serum calcium and phosphate levels serially and maintain total calcium x phosphate product below 4.2 (calcium and phosphate in mmol/l). Do not use if this is not possible.

**Cats:**

- Hypocalcaemia: dihydrotachysterol: 0.02-0.03 mg/kg p.o. q24h initially, then 0.01-0.02 mg/kg p.o. q24-48h for maintenance; calcitriol: 10-15 ng/kg/day p.o. q12h for 3-4 days, then decrease to 2.5-7.5 ng/kg p.o. q12h for 2-3 days then give q24h.
- Renal secondary hyperparathyroidism: calcitriol 2.5-3.5 ng/kg/day p.o.

**Small mammals, Birds, Reptiles:** No information available.
**Vitamin E** (Alpha tocopheryl acetate) (Multivitamin injection, Vitamin E suspension) POM-VPS

**Formulations:** Oral: 100 mg/ml suspension.

**Action:** Lipid-soluble antioxidant also regulates gene expression and is involved in cellular metabolism of sulphur compounds.

**Use:** Vitamin E supplementation is very rarely required in small animals. Patients with exocrine pancreatic insufficiency and other severe malabsorptive diseases may be at risk of developing deficiency. Its use has been suggested for numerous conditions, including discoid lupus, demodicosis and hepatic diseases including fibrosis. These are, however, only anecdotal suggestions and there may be some significant risks. Current data in human medicine show that oral supplements over 400 IU daily correlate in a linear fashion with mortality from all causes including heart disease.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in patients at high risk for thrombosis or in neonates.

**Adverse reactions:** Thrombosis.

**Drug interactions:** Vitamin E may enhance vitamin A absorption, utilization and storage. Vitamin E may alter ciclosporin pharmacokinetics and, if used concurrently, ciclosporin therapy should be monitored by checking levels.

**DOSES**

**Dogs:** 1.6-8.3 mg/kg p.o. q24h for the first 30 days, then as needed. An alternative dose is 100–400 IU.

**Cats:** 1.6–8.3 mg/kg for the first 30 days, then as needed. An alternative dose is 30 IU.

**Small mammals, Birds:** No information available.

**Reptiles:** 1 IU/kg i.m.

**Vitamin K1** (Phytonadione) (Konakion*) POM

**Formulations:** Injectable: 2 mg/ml, 10 mg/ml. Oral: 10 mg tablets; paediatric (2 mg/ml injectable) may be given orally.

**Action:** Promotes synthesis of coagulation factors II, VII, IX and X by the liver.

**Use:** Toxicity due to warfarin or coumarin and its derivatives and for hepatopathies causing significant impairment of hepatic function and/ or cholestatic disease. Deficient states may also occur in prolonged significant anorexia. Although vitamin K is a fat-soluble vitamin hormone its biological behaviour is like that of a water-soluble vitamin; it has a relatively short half-life and there are no significant storage pools. It may still require 6-12 hours for effect. Oral absorption is increased 4-5-fold in dogs if given with tinned food, especially those with increased fat content. One-stage prothrombin time is the best method of monitoring therapy. Use a small gauge needle when injecting s.c. or i.m.
Safety and handling: Normal precautions should be observed.
Contraindications: Avoid giving i.v. if possible.
Adverse reactions: Anaphylactic reactions have been reported following i.v. administration. Safety not documented in pregnant animals. Haemolytic anaemia occurs in cats when overdosed.
Drug interactions: Many drugs will antagonize the effects of vitamin K, including aspirin, chloramphenicol, allopurinol, diazoxide, cimetidine, metronidazole, erythromycin, ketoconazole, propranolol and thyroid drugs as well as coumarin- or warfarin-based anticoagulants. If the patient is on other long-term medications it is advisable to check specific literature. The absorption of oral vitamin K is reduced by mineral oil.

DOSES

Dogs:
- Known warfarin or other 1st generation coumarin toxicity or vitamin K1 deficiency: Initially 2.5 mg/kg s.c. in several sites, then 1-2.5 mg/kg in divided doses p.o. q8-12h for 5-7 days.
- Known 2nd generation coumarin (brodifacoum) toxicity: Initially 5 mg/kg s.c. in several sites, then 2.5 mg/kg p.o. q12h for 3 weeks, then re-evaluate coagulation status. The patient’s activity should be restricted for 1 week following treatment. Evaluate the coagulation status 3 weeks after cessation of treatment.
- Known inandione (diphacinone) or unknown anticoagulant toxicity: Initially 2.5-5 mg/kg s.c. over several sites. Then 2.5 mg/kg p.o. divided q8-12h for 3-4 weeks. Re-evaluate coagulation status 2 days after stopping therapy. If the PT time is elevated, continue therapy for 2 additional weeks. If not elevated repeat PT in 2 days. If normal, the animal should be rested for 1 week, if abnormal then continue therapy for an additional week and re-check PT times as above.
- Liver disease and cholestatic hepatopathy: 0.5-1.0 mg/kg s.c. q12h, for 2 days; chronic liver disease: 0.5 mg/kg p.o. q7-10d.

Cats:
- Coumarin rodenticide toxicity: doses as for dogs.
- Liver disease and cholestatic hepatopathy: 1.0 mg/kg s.c. q12h, for 2 days; chronic liver disease: 0.5 mg/kg p.o., s.c. q7-10d.

Small mammals: Ferrets: coumarin toxicity: doses as for dogs; Rabbits, Rodents: 1-10 mg/kg i.m. as needed depending upon clinical signs/clotting times.

Birds: 0.2-2.5 mg/kg i.m., p.o. q6-12h until stable, then q24h.

Reptiles: 0.5 mg/kg i.m. q24h.
**Warfarin** (Warfarin*, Marevan*) POM

**Formulations**: Oral: 0.5 mg, 1 mg, 3 mg, 5 mg tablets.

**Action**: Inhibits the synthesis of biologically active forms of the Vitamin K-dependent clotting factors (II, VII, IX and X) as well as the regulatory factors protein C, protein S and protein Z. The effect is to reduce blood clotting.

**Use**: Management of thromboembolic disorders. Monitor one-stage prothrombin time regularly and titrate dose to maintain at 1.5 times normal.

**Safety and handling**: Normal precautions should be observed.

**Contraindications**: Do not use in patients with hepatic or renal disease, or in those undergoing surgery.

**Adverse reactions**: Haemorrhage is the major adverse effect. Other adverse effects reported in humans include hypersensitivity, diarrhoea, skin necrosis, hepatic dysfunction, vomiting and pancreatitis.

**Drug interactions**: Warfarin is highly protein-bound and therefore its activity may increase if serum protein levels drop or drugs which are themselves protein-bound are administered concomitantly. In particular, NSAIDs, cimetidine, clarithromycin, erythromycin, fluoroquinolones, ketoconazole, metronidazole, potentiated sulphonamides, tetracyclines and thyroxine may enhance the anticoagulant effect of warfarin. Barbiturates and griseofulvin accelerate warfarin metabolism. The anticoagulant effect of warfarin may be enhanced or reduced by corticosteroids.

**DOSES**

**Dogs**: 0.2 mg/kg p.o. q12-24h.

**Cats**: 0.2-0.5 mg/cat p.o. q24h.

**Small mammals, Birds, Reptiles**: No information available.

---

**Xylazine** (Chanazine, Rompun, Virbaxyl, Xylacare, Xylazine, Sedaxylan, Xylapan) POM-V

**Formulations**: Injectable: 20 mg/ml solution.

**Action**: Agonist at peripheral and central alpha-2 adrenoreceptors, producing dose-dependent sedation, muscle relaxation and analgesia.

**Use**: Used to provide sedation and premedication when used alone or in combination with opioid analgesics (see Appendix for protocols). Xylazine combined with ketamine is used to provide a short duration (20-30 minutes) of surgical anaesthesia. Xylazine is less specific for the alpha-2 adrenoreceptor than is medetomidine and causes significant alpha-1 adrenoreceptor effects. This lack of specificity is likely to be associated with the poorer safety profile of xylazine
compared to medetomidine. Xylazine also sensitizes the myocardium to catecholamine arrhythmias, which increases the risk of cardiovascular complications associated with the drug. It is preferable to choose medetomidine instead of xylazine for sedation and premedication in cats and dogs. Xylazine is a potent drug that causes marked changes in the cardiovascular system. It should not be used in animals with cardiovascular or systemic disease affecting cardiovascular performance. Atipamezole is not licensed as a reversal agent for xylazine, but it is effective and can be used to reverse the effects of xylazine if an overdose is given. Spontaneous arousal from deep sedation following stimulation can occur with all alpha-2 agonists; aggressive animals sedated with xylazine must still be managed with caution. Xylazine stimulates growth hormone production and may be used to assess the pituitary’s ability to produce this hormone (xylazine stimulation test).

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Do not use in animals with cardiovascular or other systemic disease. Use of xylazine in geriatric patients is also not advisable. It causes increased uterine motility and should not be used in pregnant animals, nor in animals likely to require or receiving sympathomimetic amines. Due to effects on blood glucose, use in diabetic animals is not recommended. Avoid when vomiting is contraindicated (e.g. foreign body, raised intraocular pressure).

**Adverse reactions:** Xylazine has diverse effects on many organ systems as well as the cardiovascular system. It causes a diuresis by suppressing ADH secretion, a transient increase in blood glucose by decreasing endogenous insulin secretion, mydriasis and decreased intraocular pressure. Vomiting after i.m. xylazine is common.

**Drug interactions:** When used for premedication, xylazine will significantly reduce the dose of all other anaesthetic agents required to maintain anaesthesia.

**DOSES**

**Dogs:** 1-3 mg/kg i.v., i.m.

**Cats:** 3 mg/kg i.m.

**Small mammals:** Ferrets: 1-2 mg/kg i.m., s.c.; Rabbits: 2-5 mg/kg i.m., s.c.; Chinchillas: 1-3 mg/kg i.v., 3-5 mg/kg i.m., s.c.; Gerbils, Guinea pigs, Hamsters, Rats: 5 mg/kg i.m., 2-10 mg/kg i.p.; Mice: 10 mg/kg i.m., i.p.

**Birds:** Do not use.

**Reptiles:** No information available.

---

**Zidovudine** (Azidothymidine, AZT) (Retrovir*) POM

**Formulations:** Oral: 100, 250 mg capsules, 50 mg/5 ml syrup. Injection: 10 mg/ml solution for use as i.v. infusion.
**Action:** Competitive inhibition of reverse transcriptase. Requires activation to the 5’-triphosphate form by cellular kinases.

**Use:** Treatment of FIV-positive cats. In cats not showing clinical signs, it may delay the onset of the clinical phase. In cats showing clinical signs, it may improve recovery in combination with other therapies. In human medicine it is used in combination with other nucleoside reverse transcriptase inhibitors, e.g. abacavir, didanosine, lamivudine, stavudine, tenofovir and zalcitabine. Two of these drugs are usually used with either a non-nucleotide reverse transcriptase inhibitor or a protease inhibitor. Use of drug combinations in HIV-positive people aims to avoid the development of drug resistance. The protease inhibitors currently used in human medicine seem to lack efficacy against FIV, thus hampering this approach for FIV-infected cats in the clinical phase. Haematological monitoring is recommended.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Animals that are severely anaemic or leucopenic should not be given this drug.

**Adverse reactions:** Hepatotoxicity and severe anaemia can occur at high doses. Long-term adverse effects of lower doses have not been ascertained.

**Drug interactions:** No information available.

**DOSES**

**Cats:** 5-10 mg/kg daily p.o., s.c. in 2-4 divided doses.

**Dogs, Small mammals, Birds, Reptiles:** No information available.

---

**Zinc salts** (numerous trade names) GSL

**Formulations:** Oral: various zinc sulphate, zinc gluconate, zinc acetate and chelated zinc preparations.

**Action:** Primarily involved in DNA and RNA synthesis, although also involved in essential fatty acid synthesis, WBC function and numerous reactions in intermediary metabolism.

**Use:** Zinc-responsive dermatoses and chelation of dietary copper in patients genetically predisposed to hepatic copper storage diseases. Proposed benefit in chronic liver disease and hepatic encephalopathy. Bioavailability of elemental zinc varies depending on formulation: zinc acetate and chelated forms highest; gluconate intermediate; sulphate lowest. GI intolerance varies inversely with bioavailability.

**Safety and handling:** Normal precautions should be observed.

**Contraindications:** Pre-existing anorexia, nausea and vomiting.

**Adverse reactions:** Nausea, vomiting and occasional diarrhoea.
**Drug interactions:** Significant interactions with other divalent heavy metals such as iron and copper can occur and long-term administration of zinc may lead to decreased hepatic copper or iron stores and functional deficiency.

**DOSES**

**Dogs, Cats:** 1-2 mg elemental zinc p.o. q24h (zinc sulphate: 5 mg/kg p.o. q24h or in divided doses; zinc gluconate: 2 mg/kg p.o. q24h; zinc acetate: 1 mg/kg p.o. q24h). Give on an empty stomach to minimize vomiting.

**Small mammals, Birds, Reptiles:** No information available.

Writing a prescription

A ‘veterinary prescription’ is defined by EU law as ‘any prescription for a veterinary medicinal product issued by a professional person qualified to do so in accordance with applicable national law’. The word ‘veterinary’ takes its normal meaning ‘of or for animals’. In the UK there are two classes of medicines available only on veterinary prescription, POM-V and POM-VPS, described in the Introduction. Only in the case of POM-V medicines does the veterinary prescription have to be issued by a veterinary surgeon. The act of prescribing is taken to mean the decision made by the prescriber as to which product should be supplied, taking account of the circumstances of the animals being treated, the available authorized veterinary medicinal products and the need for responsible use of medicines.

Good prescription principles include the following. Only 1, 8, 10 and 12 are legal requirements; the remainder are good practice.

1. Print or write legibly in ink or otherwise so as to be indelible. Sign in ink with your normal signature. Include the date on which the prescription was signed.
2. Use product or approved generic name for drugs in capital letters – do not abbreviate. Ensure the full name is stated, to include the pharmaceutical form and strength.
3. State duration of treatment where known and the total quantity to be supplied.
5. Always put a 0 before an initial decimal point (e.g. 0.5 mg), but avoid the unnecessary use of a decimal point (e.g. 3 mg not 3.0 mg).
6. Give precise instructions concerning route/dose/formulation. Directions should preferably be in English without abbreviation. It is recognized that some Latin abbreviations are used (p.358).
7. Any alterations invalidate the prescription – rewrite.
8. Prescriptions for Schedule 2 and most Schedule 3 Controlled Drugs must be entirely handwritten and include the total quantity in both words and figures, the form and strength of the drug.
9. The prescription should not be repeated more than three times without re-checking the patient.
10. Include both the prescriber’s and the client’s names and addresses.
11. The directions that the prescriber wishes to appear on the labelled product. It is good practice to include the words ‘For animal treatment only’.
12. A declaration that ‘This prescription is for an animal under my care’ or words to that effect.
The following is a standard form of prescription used:

<table>
<thead>
<tr>
<th>From: Address of practice</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telephone No.</td>
<td></td>
</tr>
<tr>
<td>Animal's name</td>
<td>Owner's name</td>
</tr>
<tr>
<td></td>
<td>Owner's address</td>
</tr>
</tbody>
</table>

Rx  Print name, strength and formulation of drug
Total quantity to be supplied
Amount to be administered
Frequency of administration
Duration of treatment

For animal treatment only
For an animal under my care

Non-repeat/repeat X 1, 2 or 3
Name and Signature of veterinary surgeon

Note: Prescriptions for Schedule 2 and 3 Controlled Drugs (with the exception of phenobarbital and temazepam) must be written in longhand by the prescribing veterinary surgeon and meet the prescription requirements of the Misuse of Drugs Regulations 1985. It is not acceptable to use typewriting or the handwriting of any other person.

**Dosing small and exotic animals**

Past editions of the Formulary have contained tables of doses or applications of drugs for various ‘exotic’ animals. However, for this edition all doses are included in the relevant monographs together with comments on their use in various species. This has been done because of the increasing range of species that are included in the Formulary. Veterinary surgeons who are unfamiliar with the actions of a particular drug in a given exotic species are advised to consult more complete references (see Further reading).

The size of some animals, particularly ‘exotic pets’, makes dosing difficult and care must be taken when calculating small doses. Some points to bear in mind when dosing are:

- Where powders are to be dissolved in water, sterile water for injection should be used.
- Most **solutions** may be diluted with water for injection or 0.9% saline.
- Dilution will be necessary when volumes <0.1 ml are to be administered.
- Suspensions cannot be diluted.
- Use 1 ml syringes for greatest accuracy.
- When reformulating tablets, consider using a pharmacist.
Antibacterial selection

Antibiotic selection according to organ system

**Bone:** Most antibacterials penetrate bone, as it has a good blood supply, and are then distributed in interstitial fluid. Osteomyelitis is often caused by *Staphylococcus* spp., although obligate anaerobes and Gram-negative Enterobacteriaceae may be involved. Choice of drug therapy should be made after culture of bone fragments removed at surgery; otherwise, drugs effective against beta-lactamase-producing staphylococci and obligate anaerobes should be chosen. These include:

- Amoxicillin/Clavulanate
- Clindamycin
- Cefalexin
- Lincomycin

**Urinary tract:** Many antibacterials attain high concentrations in urine since this is a major route of excretion for drugs. If a drug is filtered but not reabsorbed to any extent, its urine concentration exceeds its plasma concentration by 100-fold. Some drugs are actively secreted into urine (e.g. beta-lactams) and reach concentrations that are 300 times higher than plasma concentrations. The susceptibility of urinary pathogens is fairly predictable; if the animal has not been treated with antibacterial drugs in the last couple of months, the following antibacterial drugs are successful in more than 80% of cases of uncomplicated lower urinary tract infections according to the causative organism involved.

- *Escherichia coli*: Potentiated sulphonamide
- *Staphylococcus* spp.: Ampicillin or amoxicillin
- *Streptococcus* spp.: Ampicillin or amoxicillin
- *Proteus mirabilis*: Ampicillin or amoxicillin
- *Klebsiella pneumoniae*: Cefalexin
- *Pseudomonas aeruginosa*: Oxytetracycline
- *Enterobacter*: Potentiated sulphonamides

Recurrent or relapsing urinary tract infections should have cultures and sensitivity tests performed to determine the most appropriate antibacterial drug. Fluoroquinolones and clavulanate-potentiated penicillins should be reserved for the more difficult infections. Aminoglycosides may be required in some cases, but their nephrotoxic effects should always be considered in cases where renal involvement may be present.

**Prostate:** Many antimicrobials attain therapeutic concentrations in the prostate during acute prostatitis. Only a few penetrate the prostate in chronic prostatitis. These include highly lipophilic drugs, and those that are weak bases have the added advantage that they will be ion-trapped in the acidic prostatic fluid. Examples include:
Consider also the spectrum of activity. For example, potentiated sulphonamides have a reasonably broad spectrum of activity whilst clindamycin has better activity against Gram-positive organisms. Fluoroquinolones are also ‘broad spectrum’ with superior activity against Gram-negative organisms.

**Hepatic/biliary system:** Antibacterials that penetrate liver and biliary tract well include:

- Aminoglycosides
- Amoxicillin
- Amoxicillin/clavulanate
- Ampicillin
- Cefalexin
- Clindamycin
- Fluoroquinolones
- Metronidazole

It should be noted that some of these agents should be avoided in hepatic insufficiency (see below). Antimicrobials from the above list that do not require hepatic metabolism include the beta-lactams and the aminoglycosides.

**Respiratory system:** Most antibacterials penetrate the pulmonary parenchyma. However, lipid-soluble drugs are recommended for bronchial infections. These include:

- Doxycycline
- Fluoroquinolones
- Potentiated sulphonamides
- Amoxicillin
- Ticarcillin
- Ampicillin

**Central nervous system:** The following drugs may be useful in CNS infections:

**Good penetration:**

- Chloramphenicol
- Fluoroquinolones
- Metronidazole
- Trimethoprim/sulphonamides

Note: Beta-lactams are organic acids, which are mainly ionized at physiological pH and will only penetrate if there is inflammation.

**Intermediate penetration:**

- Amoxicillin
- Ticarcillin
- Ampicillin

**Antimicrobials in small mammals**

Antimicrobial therapy in several small mammal species poses a greater risk when compared with other species due to the suppression of normal bacterial flora, resulting in overgrowth of other species, notably *Clostridium*, resulting in enterotoxaemia and death. Mice, rats, ferrets and usually gerbils are fairly resistant, whereas hamsters, guinea pigs, chinchillas and rabbits are more susceptible. The risk of enterotoxaemia is related to several factors including the drug selected, its dose, route of administration and also the animal’s
nutritional status and general health. In general: penicillins, clindamycin and lincomycin are more likely to cause enterotoxaemia, whereas cephalosporins and erythromycin are less likely to do so; aminoglycosides, fluoroquinolones, metronidazole and sulphonamides are the least risky. Tetracyclines are risky in the guinea pig but appear less so in other species (Prescott et al., 2000). See individual monographs for more details.

**Radiographic contrast agents**

**Barium contrast media**

There is a wide variety of preparations of barium sulphate used in veterinary radiography. None of these preparations is authorized for veterinary use and most are POM.

</tbody>
</table>

**Action**

Barium sulphate has a higher atomic number than body tissues and therefore appears radiopaque. Barium sulphate is inert with no osmotic potential and is not absorbed or acted upon by alimentary secretions.
Use
Used for gastrointestinal (GI) and oesophageal contrast studies. Enables visualization of lumen of oesophagus and GI tract. Barium impregnated polyethylene spheres (BIPS) may be used to assess intestinal transit times, gastric emptying rate and to detect obstructions. As with all contrast studies, plain radiographs should be taken prior to administration of barium. Barium paste is used for oesophageal studies as it adheres to mucosa. Barium can also be mixed with food to evaluate the oesophagus, and may demonstrate strictures or dilatations not seen with liquid barium or paste. Barium/food mixtures are rarely indicated for GI tract studies. Liquid barium may be used to evaluate any part of the GI tract and is used alone for evaluation of the stomach and intestines. Refer to radiographic texts for details of how to perform contrast studies. Flavoured preparations designed for human use may be unpalatable for some animals. Mixing of barium with methycellulose may improve the quality of GI tract studies.

Safety and handling
Skin irritation may occur with skin contact.

Contraindications and adverse reactions
Barium is insoluble and should not be used outside the GI tract. If endoscopy is going to follow contrast radiography it is preferable to use a water-soluble contrast medium, as barium will prevent evaluation of the mucosa. Leakage of barium into body cavities may lead to granulomatous reactions or adhesions. If oesophageal or GI tract perforation is suspected, low-osmolar water-soluble contrast media should be used. Aspiration of barium during administration or as a result of vomiting or regurgitation can lead to aspiration pneumonia. May cause constipation, transient diarrhoea and abdominal pain.

Drug interactions
None

Doses and advice on use
Must only be given p.o. Readers are referred to radiographic texts for details of doses and techniques.

Iodinated contrast media
There is a wide range of iodinated contrast media available. None is authorized for veterinary use and most are POM.

Action
Iodinated contrast media appear radiopaque on a radiograph due to iodine having a higher atomic number than soft tissues.

</tbody>
</table>
Use
Contrast studies of the GI tract and urinary tract, angiography, arthrography, sialography, dacryocystography, sino- or fistulography and myelography. Only non-ionic agents may be used for myelography, but not all non-ionic agents are authorized for myelography in humans.

Contraindications
Known or suspected sensitivity to iodine-containing preparations. Uncontrolled hyperthyroidism is a contraindication in humans. Should be used with care in animals with moderate to severe impairment of renal function. Primarily excreted via kidneys and pre-existing renal disease predisposes to contrast media-induced renal failure. Fluid and electrolyte disturbances should be corrected prior to use.

Adverse reactions
Anaphylaxis may occur following i.v. injection of any iodinated contrast medium. Nausea, vomiting, hypotension, dyspnoea, erythema, urticaria, sensation of heat, and cardiac rate or rhythm disturbances have been reported in humans following i.v. injection. Seizures or transient motor or sensory dysfunction have been reported in humans following myelography. Aspiration of high osmolar contrast media may result in pulmonary oedema. May aggravate clinical signs in patients with myasthenia gravis. These effects are more common with ionic than with non-ionic media and with hyper-osmolar media. Non-ionic low-osmolar and iso-osmolar agents have fewer adverse effects on the cardiovascular system and are safer in neonates and animals with cardiovascular disease. When used intravascularly, catheters should be flushed regularly to minimize risk of clotting; non-ionic media have less anticoagulant activity in vitro than ionic preparations. Extravasation of high-osmolar agents may rarely lead to soft tissue injury. Warming the contrast media prior to injection reduces minor side effects. Specific formulations for GI contrast studies cannot be used for other examinations due to the presence of additives.

Drug interactions
Iodinated contrast media decrease thyroid uptake of iodine and preclude therapeutic radioiodine therapy for 2 months following administration. Hypersensitivity reactions may be aggravated in patients on beta blockers.

Doses and advice on use
Consult standard radiographic texts for doses and details of how to perform procedures.

MRI contrast media
Several gadolinium chelates are used in magnetic resonance imaging (MRI) studies. None of them is authorized for veterinary use and all are POM.
Action
Gadolinium exerts its paramagnetic effects due to 7 unpaired electrons, which cause a shortening of T1 and T2 relaxation times of adjacent tissues. This results in an increased signal on T1-weighted MR images. Gadolinium is toxic so is chelated to reduce toxicity. Gadolinium chelates do not cross the normal blood–brain barrier due to their large molecular size.

Use
During MRI to identify areas of abnormal vascularization or increased interstitial fluid, delineate masses, demonstrate disruption of the blood–brain barrier and areas of inflammation. Gadoteric acid and gadofosveset are also used for contrast-enhanced magnetic resonance angiography (MRA). Gadobenic acid and gadoxetic acid are also transported across hepatocyte cell membranes (gadoxetic acid via organic anionic-acid transporting peptide 1) and are used in the characterization of liver lesions.

Safety and handling
Contact with skin and eyes may cause mild irritation.

Contraindications
Use with caution in cardiac disease, pre-existing renal disease and neonates. Contraindicated in severe renal impairment.

Adverse reactions
Nephrogenic systemic fibrosis (most commonly with gadodiamide) reported in humans but not in animals. Increase in QT interval and other arrhythmias have also been reported, and cardiac monitoring is recommended in the event of accidental overdosage. Many are hyper-osmolar and irritant if extravasation, therefore should be given through intravenous catheter. May cause transient increase in serum bilirubin if pre-existing hepatic disease. In experimental studies may cause fetal abnormalities in rabbits.

Drug interactions
May have interactions with Class 1a and 3 antiarrhythmics. Gadobenic acid may compete for canannicular multispecific organic anionic transporter sites. Caution should be used if administering cisplatin, anthracyclines, vinca alkyloids and other drugs using this transporter. Anionic drugs excreted in bile (e.g. rifampicin) may reduce hepatic uptake of gadoxetic acid, reducing contrast enhancement. May affect some laboratory results, e.g. serum iron determination using complexometric methods may be affected, transient increase in liver enzymes, false reduction in calcium.

Doses and further advice on use
Should be used routinely for MRI examinations of the brain. Use for MRI of other areas if suspect abnormal vascularization, inflammation, neoplasia, for post-surgical evaluation or if MRI study is normal. Post-contrast images should ideally be obtained within 30 minutes of contrast administration. Total doses should not exceed 0.3 mmol/kg (varies with product).

**Dogs:** 0.1 mmol/kg i.v. (all except gadofosveset and gadoxetic acid). Give as bolus if performing MRA or liver studies; 0.025 mmol/kg i.v. bolus of gadoxetic acid for liver studies; 0.05 mmol/kg of gadobenic acid for liver studies; 0.03 mmol/kg of gadofosveset for MRA. Repeat doses (not gadoxetic acid or gadofosveset) of up to 0.3 mmol/kg total dose may be helpful in some cases if poor contrast enhancement with standard dose or for detection of metastases and if using low-field scanner. Enhancement visible up to 45–60 minutes post-administration.

* Note that there is some evidence from clinical trials that products that do not contain a specific acaricidal compound may nevertheless be effective at treating infestations of ear mites. The mode of action is unclear but the vehicle for these polypharmaceutical products may be involved.

In addition, there is Dermisol cream which contains a mixture of organic acids to aid removal of embedded debris and dead tissue.

None of these products should be used where ear drum perforation is suspected.

## Sedative protocols

### Sedative combinations for dogs

**Acepromazine (ACP):** Acepromazine alone is not a particularly effective sedative. Increasing the dose above 0.1 mg/kg does little to improve the predictability of achieving adequate sedation but increases the risk of incurring adverse effects, increases the severity of adverse effects and prolongs the duration of action of any effects (desirable or adverse) that arise. Doses of 0.0125 to 0.1 mg/kg may be given by slow i.v., i.m. or s.c. injection. Doses >0.025 mg/kg should not be used in Boxers or giant breeds.

**Neuroleptanalgesia:** Acepromazine used in combination with opioid analgesics reduces the dose requirement of both components and the incidence of adverse effects. Acepromazine (0.0125–0.05 mg/kg) can be combined with:
Pethidine 2–10 mg/kg i.m.
Morphine 0.1–1.0 mg/kg i.m.
Papaveretum 0.2–2.0 mg/kg i.m.
Buprenorphine 0.005–0.01 mg/kg i.v., i.m.
Butorphanol 0.1–0.3 mg/kg i.v., i.m.
Pentazocine 1–3 mg/kg slow i.v.

**Alpha-2 agonists and alpha-2 agonist/opioid mixtures:**
Medetomidine may be used alone at 0.01–0.08 mg/kg i.m. Low doses (0.0025 mg/kg) may be given i.v. Adverse effects may be antagonized with i.m. atipamezole at 5 times the agonist dose rate; the (unauthorized) i.v. route is preferable in critical situations.

Xylazine (1–3 mg/kg) may be used alone, given i.m. or i.v. (unauthorized). Adverse effects may be antagonized with i.m. or i.v. atipamezole, although this use is unauthorized.

Including opioids with medetomidine or xylazine lowers the dose required to achieve a given level of sedation and limits the severe effects that alpha-2 agonists exert on cardiopulmonary function.

Medetomidine (0.0025–0.01 mg/kg) or xylazine (1 mg/kg) can be combined with:

Pethidine 2 mg/kg i.m.
Buprenorphine 0.005–0.01 mg/kg slow i.v., i.m.
Butorphanol 0.1–0.2 mg/kg slow i.v., i.m.

Whilst alpha-2 agonist/opioid combinations are safer than alpha-2 agonists alone, they should only be used in healthy animals.

**Acepromazine/alpha-2 agonist/opioid mixtures:** A mixture of acepromazine (0.1 mg/kg) with any of the combinations given for alpha-2 agonists and alpha-2 agonist/opioid mixtures (higher end of dose ranges) is suitable for the chemical restraint of large, dangerously aggressive dogs. Severe depression can be antagonized using naloxone and atipamezole.

Low doses of acepromazine (0.01 mg/kg) and medetomidine (0.0025 mg/kg) combined with opioid agonist drugs provide profound sedation without signs of severe cardiopulmonary depression.

**Benzodiazepines and benzodiazepine/opioid mixtures:**
Benzodiazepines do not reliably sedate dogs when used alone; indeed, stimulation ranging from increased motor activity to gross excitation may be seen. The risk of excitation is proportional to the health of the recipient: the chances of producing sedation are highest (but not guaranteed) in very sick cases. Diazepam (0.1–0.25 mg/kg i.v.) or midazolam (0.05–0.25 mg/kg i.v.) given during anaesthesia can smooth recovery in animals prone to excitability, provided adequate analgesia is present.
Appendix

Opioid/benzodiazepine mixtures are satisfactory and relatively safe in critically ill animals. The opioid component (listed below) is given first, and usually produces little, if any, effect.

<table>

</tbody>
</table>

Satisfactory sedation usually results when either diazepam (0.25 mg/kg) or midazolam (0.25 mg/kg) is given by slow i.v. injection 20–30 minutes later.

**General notes:**

- A well managed light level of general (inhalational) anaesthesia is frequently safer than heavy sedation in sick animals.
- Neuroleptanalgesic combinations are safer than alpha-2 agonist/opioid mixtures, but are less likely to produce adequate conditions for minor operations or investigations involving abnormal body positions. Furthermore, only the opioid component can be antagonized.
- In very ill animals, benzodiazepines given 20–30 minutes after neuroleptanalgesic combinations have been injected are likely to produce the best compromise between adequate conditions and patient safety.
- Most of the aforementioned combinations will have a profound sparing effect on i.v. and inhalational anaesthetics, should a general anaesthetic be required after sedation. This is particularly true of combinations containing alpha-2 agonists. When given slowly i.v., atipamezole will counter severe physiological derangement in dogs which have been given medetomidine and are subsequently anaesthetized with inhalation anaesthetics. Anaesthesia may ‘lighten’ but a full return to consciousness will not occur if inspired concentrations are adequate.

**Sedative combinations for cats**

**Acepromazine:** Acepromazine alone is not a particularly effective sedative and increasing the dose incurs the same problems as in dogs. Doses of 0.025–0.1 mg/kg may be given i.m. or s.c.

**Neuroleptanalgesia:** Neuroleptanalgesic combinations confer the same advantages in cats as in dogs. Acepromazine (0.05–0.1 mg/kg) can be combined with:
Pethidine  2–10 mg/kg i.m.
Morphine  0.1–0.2 mg/kg i.m.
Papaveretum  0.2–0.4 mg/kg i.m.
Buprenorphine  0.005–0.01 mg/kg i.m.
Butorphanol  0.1–0.3 mg/kg i.m.

**Alpha-2 agonists and alpha-2 agonist/opioid mixtures:**
Medetomidine may be used alone at 0.025–0.08 mg/kg i.m. Adverse effects may be antagonized with i.m. atipamezole at 2.5 times the agonist dose rate.

Xylazine (1–3 mg/kg) may be used alone given by i.m. injection. Adverse effects may be antagonized with i.m. or i.v. atipamezole, although this use is unauthorized.

Including opioids with medetomidine or xylazine lowers the dose required to achieve a given level of sedation and limits the severe effects that alpha-2 agonists exert on cardiopulmonary function.

Medetomidine (0.025–0.05mg/kg) or xylazine (1 mg/kg) can be combined with:

- Pethidine  2 mg/kg i.m.
- Buprenorphine  0.005–0.02 mg/kg slow i.v., i.m.
- Butorphanol  0.1–0.2 mg/kg slow i.v., i.m.

Whilst alpha-2 agonist/opioid combinations are safer than alpha-2 agonists alone, they should only be used in healthy animals.

**Benzodiazepines:** Diazepam (0.25 mg/kg) or midazolam (0.25 mg/kg) i.v. can provide satisfactory sedation in very sick cats. The inclusion of opioids at doses given for alpha-2 agonist/opioid mixtures may improve conditions.

**Ketamine and ketamine-based techniques:** Ketamine is relatively safe in ill animals, but high doses cause prolonged recoveries and are associated with muscle rigidity. Acepromazine (0.05–0.1mg/kg) with midazolam (0.25 mg/kg) or diazepam (0.25 mg/kg) and ketamine at either 2.5, 5 or 7.5 mg/kg, mixed and injected i.m., provides good conditions with only modest cardiopulmonary depression. The higher doses of ketamine should be used in excitable animals undergoing more stimulating interventions. Lower doses of acepromazine and/or ketamine may be used in very ill animals. Excluding the benzodiazepine component or the acepromazine from this combination reduces its efficacy without increasing safety.

**Alternatives:** Ketamine (2.5 mg/kg) combined with diazepam (0.25 mg/kg) i.v. provides profound sedation which lasts for about 15–20 minutes.
Ketamine (5 mg/kg) with medetomidine 50–75 µg (micrograms)/kg i.m. produces profound sedation but should only be used in healthy cats. Atipamezole may be given if severe problems are encountered. Xylazine (0.5–1.0 mg/kg) may be used instead of medetomidine, but is no safer.

Although ketamine elimination depends heavily on renal function in cats, a full recovery still occurs, albeit more slowly, in animals with renal disease or urinary tract obstruction. However, low doses should be used in such cases.

**General notes:**

- A crush cage is useful for restraining violent cats for i.m. injection. If these are unavailable, the animal, within its cage, may be placed in a large ‘bin-bag’ into which inhalational anaesthetics are piped. Most of the aforementioned combinations will have a profound sparing effect on i.v. and inhalational anaesthetics should a general anaesthetic be required after sedation. This is particularly true of combinations containing alpha-2 agonists. When given slowly i.v., atipamezole will counter severe physiological derangement in cats that have been given medetomidine and are subsequently anaesthetized with inhalation anaesthetics.
- The high body surface area:volume ratio of cats results in rapid heat loss compared with dogs. Attention to thermoregulation must be diligent.

**Sedative combinations for exotic pets**

**Small mammals:** Ketamine 40–50 mg/kg i.m. or 200 mg/kg i.p. plus xylazine 2–5 mg/kg i.m. or 10 mg/kg i.p.

or ketamine 40–50 mg/kg i.m. or 200 mg/kg i.p. plus diazepam 1 mg/kg i.m. or 2.5 mg/kg i.p.

or ketamine 40–50 mg/kg i.m. or 200 mg/kg i.p. plus medetomidine 0.5 mg/kg i.m. (not rabbits) or fentanyl/fluanisone 0.3 ml/kg plus diazepam 1 mg/kg i.v., i.m. or 2.5–5.0 mg/kg i.p.

or fentanyl/fluanisone 0.3 ml/kg plus midazolam 1.0–2.5 mg/kg i.v., i.m., i.p.

**Ferrets:** Ketamine 5–8 mg/kg i.m. plus medetomidine 0.1 mg/kg i.m. or xylazine 2 mg/kg i.m. plus butorphanol 0.2 mg/kg i.m.

NB. Reduce doses if animal is debilitated.

**Rabbits:** As for small mammals except ketamine 15 mg/kg s.c. plus medetomidine 0.25 mg/kg s.c., to which can be added butorphanol 0.4 mg/kg s.c.
**Birds:** Injectable anaesthesia is best avoided unless in field situations (i.e. no gaseous anaesthesia available) or for the induction of large (e.g. swans/ratites), diving (e.g. ducks) or high altitude birds. Even in these species, gaseous induction and maintenance (e.g. with isoflurane/sevoflurane) would still be the normal recommendation wherever possible. Premedicants are rarely used as extra handling will add to the general stress of the situation. On occasions, diazepam may be used at 0.2–0.5 mg/kg i.m. (or midazolam 0.1–0.5 mg/kg i.m.); either drug may be used at 0.05–0.15 mg/kg i.v. Parasympatholytic agents (such as atropine) are also rarely used as their effect is make respiratory secretions more viscous, thus increasing the risk of tube blockage.

Propofol 10 mg i.v. by slow infusion to effect: supplemental doses up to 3 mg/kg.

Ketamine/diazepam combinations can be used for induction and muscle relaxation. Ketamine 30–40 mg/kg plus diazepam 1.0–1.5 mg/kg are given slowly i.v. to effect. May also be given i.m. but this produces different effects in different species and specific literature or specialist advise should be consulted.

Ketamine/medetomidine combinations can be used for raptors: ketamine 2–5 mg/kg i.m. plus medetomidine 25–100 µg/kg (micrograms) (lower dose rate i.v.; higher rate i.m.). This combination can be reversed with atipamezole at 65 µg/kg (micrograms) i.m. Ketamine should be avoided in vultures.

**Reptiles:** Ketamine 20–60 mg/kg i.m. (chelonians); 25–60 mg/kg i.m. (lizards); 20–80 mg/kg i.m. (snakes). NB. Use lower end of dosage for sedation in all species. Recovery may be prolonged even with low dosages in debilitated, particularly renal compromised, patients.

or ketamine 5–10 mg/kg i.m. plus medetomidine 100–200 µg/kg (micrograms) (deep sedation to light anaesthesia) (may reverse medetomidine with atipamezole at 5x medetomidine dosage in mg/kg, e.g. 0.5–1.0 mg/kg atipamezole).

or ketamine 20–60 mg/kg i.m. plus midazolam 1–2 mg/kg (chelonians sedation to light anaesthesia).

Alfaxalone 15 mg/kg i.m. or 5–9 mg/kg i.v. (preferred) provides deep sedation/anaesthesia in chelonians (preferable to perform intermittent positive pressure ventilation with 100% oxygen after administration to prevent hypoxia).

Midazolam 0.5–2 mg/kg i.m. sedation for imaging/non-noxious procedures.

Propofol 10–15 mg/kg i.v., intraosseously will give 10–15 minutes sedation/light anaesthesia (preferable to perform intermittent positive pressure ventilation with 100% oxygen after administration to prevent hypoxia). May also be given intracoeloemically to small chelonians.
Chemotherapy protocols for lymphoma

Various protocols are described in the literature. Two examples are provided below.

**Protocol 1: Combination cytotoxic therapy COP (low dose)**

**Induction:** Cyclophosphamide: 50 mg/m² p.o. on alternate days or 50 mg/m² p.o. for the first 4 days of each week.
Vincristine: 0.5 mg/m² i.v. q7d.
Prednisolone: 40 mg/m² p.o. q24h for first 7 days then 20 mg/m² p.o. on alternate days and given with cyclophosphamide.

**Maintenance after a minimum of 2 months:** Cyclophosphamide: 50 mg/m² p.o. on alternate days or 50 mg/m² p.o. for the first 4 days of each second week (alternate week therapy).
Vincristine: 0.5 mg/m² i.v. q14d.
Prednisolone: 20 mg/m² p.o. on alternate days of each second week and given with cyclophosphamide.

**Maintenance after 6 months (if disease in remission):**
Cyclophosphamide: 50 mg/m² p.o. q48h or 50 mg/m² p.o. for the first 4 days of each third week (one week in three).
Vincristine: 0.5 mg/m² i.v. q21d.
Prednisolone: 20 mg/m² p.o. on alternate days of each third week and given with cyclophosphamide.

**Maintenance after 12 months:** Cyclophosphamide: 50 mg/m² p.o. q48h or 50 mg/m² p.o. for the first 4 days of each fourth week (one week in four).
Vincristine: 0.5 mg/m² i.v. q28d.
Prednisolone: 20 mg/m² p.o. on alternate days of each fourth week and given with cyclophosphamide.

**General notes:**
- Melphalan (5 mg/m² p.o.) may be administered as an alternative to cyclophosphamide after 6 months in order to reduce the risk of haemorrhagic cystitis.
- Chlorambucil (5 mg/m² p.o. on alternate days) or melphalan may be given as alternatives for cyclophosphamide if haemorrhagic cystitis develops.
- Doxorubicin (30 mg/m² i.v. q3w) or crisantaspase (10,000–20,000 IU/m² i.m. q7d or as necessary) may be used to manage relapsing or recurrent disease. (Refer to specialist texts or advice regarding protocols for treating relapsed lymphoma.)
Protocol 2: Combination cytotoxic therapy COP (high dose)

**Induction:** Cyclophosphamide: 250–300 mg/m² p.o. q21d.
Vincristine: 0.75 mg/m² i.v. q7d for 4 weeks then 0.75 mg/m² i.v. q21d administered with cyclophosphamide.
Prednisolone: 1 mg/kg p.o. q24h for 4 weeks then 1 mg/kg p.o. on alternate days.

**Maintenance after 12 months:** Cyclophosphamide: 250–300 mg/m² p.o. q28d.
Vincristine: 0.75 mg/m² i.v. q28d with cyclophosphamide.
Prednisolone: 1 mg/kg p.o. on alternate days.

**General note:**
Some authors recommend a maximum cyclophosphamide dose in dogs of 250 mg/m².

**Contraindications and adverse effects**
Myelosuppression, haemorrhagic cystitis (cyclophosphamide only) or GI effects may occur. Peripheral neuropathies, although reported, are rare. Perform a complete blood count (CBC) with platelet count regularly during the induction course (every 3 weeks prior to cyclophosphamide treatment for high dose regime). Discontinue cyclophosphamide therapy if the neutrophil count decreases to <2 x 10⁹/l; check count weekly and do not resume treatment until neutrophil count is >3 x 10⁹/l. If neutropenia recurs following reinstitution of therapy, decrease dosage by one quarter.

**Drugs usage in renal and hepatic insufficiency**
With failure of liver or kidney, the excretion of some drugs may be impaired, leading to increased serum concentrations.

**Renal failure**

a Double the dosing interval or halve the dosage in patients with severe renal insufficiency. Use for drugs that are relatively non-toxic.

b Increase dosing interval 2-fold when creatinine clearance (Ccr) is 0.5–1.0 ml/min/kg, 3-fold when Ccr is 0.3–0.5 ml/min/kg and 4-fold when Ccr is <0.3 ml/min/kg.

c Precise dose modification is required for some toxic drugs that are excreted solely by glomerular filtration, e.g. aminoglycosides. This is determined by using the dose fraction Kf to amend the drug dose or dosing interval according to the following equations:
Modified dose reduction = normal dose x $K_f$
Modified dose interval = normal dose interval/$K_f$

where $K_f = \frac{\text{patient } \text{Ccr}}{\text{normal Ccr}}$

Where Ccr is unavailable, Ccr may be estimated at $\frac{88.4}{\text{serum creatinine (µmol/l)}}$ (where serum creatinine is $<350$ µmol/l).
$K_f$ may be estimated at 0.33 if urine is isosthenuric or 0.25 if the patient is azotaemic.

a, b, c = Refer to section above on dose adjustment; A = Avoid in severe renal failure; Cl = Contraindicated; N = normal dose.
Hepatic insufficiency
Drug clearance by the liver is affected by many factors and thus it is not possible to apply a simple formula to drug dosing. The table below is adapted from information in the human literature.

Suspected Adverse Reaction report form

ASSURING THE SAFETY, QUALITY AND EFFICACY OF VETERINARY MEDICINES

Department for Environment, Food & Rural Affairs
Veterinary Medicines Directorate,
FREEPOST KT4503, Woodham Lane, New Haw,
Addlestone, Surrey KT15 3BR
Tel. No: 01932 338427 Fax: 01932 336618

IN CONFIDENCE

Suspected Adverse Reaction Surveillance Scheme (SARSS)

Animal suspected adverse reaction report

- This form should be completed in BLOCK LETTERS and sent to the FREEPOST address given above, whenever a suspected adverse reaction is observed in animals (including birds and fish) during or after the use of a veterinary medicine.

All reporters MUST complete this section

Full name of product

Product number (on label)* Batch number

Full name and address of person sending this form to the VMD

County: Postcode: Date __/__/___

Full address where reaction(s) occurred

County: Postcode:

Full name and address of veterinarian involved

County: Postcode:

This form will be copied to the Company (Marketing Authorisation holder) in order that they are aware of any reported suspected adverse reaction to their product. They may wish to contact you for further details. If you do not want the name(s) and address(es) on the form to be revealed to the Company, please tick this box

Has the Company already been informed? YES NO

Your reference No. (if any)

MLA 252A (Rev. 8/01)
**Details of animal suspected adverse reaction(s)**

# Nutritional/fluids

**Nutritional supplements**
- Amino acid solutions 13
- Lipid infusions 190
- Medium chain triglycerides 201

**Crystalloids**
- Sodium chloride 311

**Glucose supplements**
- Glucose 152

**Mineral and electrolyte supplements**
- Calcium salts 46
- Iron salts 172
- Magnesium salts 195
- Phosphate 271
- Potassium salts 279
- Sodium bicarbonate 310
- Zinc salts 356

**Plasma substitutes**
- Dextran 92
- Etherified starch 127
- Gelatine 149

**Vitamin supplements**
- Nicotinamide 237
- Vitamin A 346
- Vitamin B complex 347
- Vitamin B1 348
- Vitamin B12 349
- Vitamin C 349
- Vitamin D 350
- Vitamin E 352
- Vitamin K1 352

# Ophthalmic

**Antivirals**
- Aciclovir 4
- Lysine 195
- Trifluorothymidine 336

**Antibacterials**
- Ciprofloxacin 68

**Anti-inflammatory steroids**
- Fluorometholone 141

**Glaucoma therapy**
- Acetazolamide 2
- Apraclonidine 25
- Betaxolol 35
- Brinzolamide 38
- Dorzolamide 110
- Glycerol 153
- Latanoprost 183
- Pilocarpine 272
- Timolol maleate 330
- Travoprost 334

**Mydriatics**
- Cyclopentolate 80
- Phenylephrine 268
- Tropicamide 339

**Non-steroidal anti-inflammatory drugs**
- Diclofenac 97
- Flurbiprofen 143
- Ketorolac 181

**Tear substitutes**
- Carbomer 980 50
- Hyaunronate 160
- Hypermellose 165
- Polyvinyl alcohol 277

**Topical anaesthetics**
- Proxymetacaine 295
- Tetracaine 324

**Immunosuppressives**
- Ciclosporin(e) 64
- Tacrolimus 320

# Respiratory system

**Anti-inflammatory steroids**
- Fluticasone 144

**Antitussives**
- Codeine 78

**Bronchodilators**
- Aminophylline 14
- Etamiphylline 126
- Propentofylline 291
- Salbutamol 303

**Mucolytics**
- Bromhexine 39

**Nasal decongestants**
- Oxymetazoline 249
- Phenylpropanolamine 269

**Respiratory stimulants**
- Doxapram 111
Index of generic and trade names

Index

Generic names are in plain type.
Trade names are in italics;
asterisks denote products not
authorized for use in veterinary
species.

Abelcet* 20
Acarbose 1
Aclaim spray 213
Acepromazine 1
Acetaminophen see Paracetamol
Acetazolamide 2
Acetylcysteine 3
Acetylsalicylic acid see Aspirin
Aciclovir 4
Acicledex 10
ACP 1
ACTH see Tetracosactide
Actidose-Aqua* 59
Actinomycin-D see Dactinomycin
Actilyse* see Streptokinase
Activated charcoal see Charcoal
Activyl 51
Acular* 181
Addiphos 271
Adequan 277
ADH see Vasopressin
Adrenaline 5
Advance* 229
Advantage 166
Advantix 166
Advocate 166
Afrazine* 249
Aglepristone 6
Aknemin* 224
Alcohol BP* 126
Aldactone* 315
Alfacalcidol* 350
Alfaxalone 7
Alfaxan CD 7
Alfentanil 8
Alizin 6
Alkeran* 207
Alkoren 9
Aloxi* see Ondansetron
Alpha tocopherol acetate see
Vitamin E
Alprazolam 9
Alteplase see Streptokinase
Alucap* 10

Aludex 16
Aluminium antacids 10
Aluminium hydroxide see
Aluminium antacids
Amantadine 11
AmBisome* 20
Amethocaine 324
Amfipen 22
Amiloride 13
Amino acid solutions 13
Aminophylline 14
Aminoplasma* 13
Aminovin* 13
Amiodarone 15
Amitraz 16
Amitriptyline 17
Amlodipine 17
Amoxicillin 18
Amoxicillin/Clavulanate 19
Amoxinsol 18
Amoxival 18
Amoxycilline see Amoxicillin
Amoxycillin 18
Amoxicillin 22
Amphotericin B 20
Amphoterin B 20
Ampicaps 22
Ampicillin 22
Amprolium 23
Analgin 209
Ancotil* 140
Animec 176
Anistreplase see Streptokinase
Anivit 4BC 347
Anivit B12 349
Antepsin* 318
Antirobe 72
Antisedan 28
Antivenom (European Adder) 23
Antizol* 145
Anzemet* see Ondansetron
APO-go* 24
Appetex 71
Apapronidine 25
Apresoline* 161
Aqupharm 152, 311
Ara-C see Cytarabine
Arava* 184
Aredia* 252
Arnica 25
Arnicare 25
Ascorbic acid see Vitamin C
Asilone* 10
Asparaginase see Crisantaspase
Aspirin 26
Atarax* 164
Atenolol 27
Atipamezole 28
Ativan 194
Atopica 64
Atracurium 29
Atrocare 30
Atropine 30, 105
Augmentin 19
Aureomycin 63
Aurizon 90, 197
Auroto 234, 329
Axit* 242
Azathioprine 31
Azidothymidine see Zidovudine
Azithromycin 32
Azopt* 38
AZT see Zidovudine
Bactroban* 230
Baytril 119
BCK 59, 177
BCK granules 37
Benazepril 33
Benzoyl peroxide 33
Benzylox penicillin see Penicillin G
Beta Cardone* 314
Betamethasone 34
Betaxolol 35
Bethanechol 36
Betnesol* 34
Betoptic* 35
Betsolan 34
Bilosin 340
Bimectin 176
Bimexil 18
Biozine 275
Bisacodyl 36
Bismuth salts 37
Bisolvon 39
Bonefos* 73
Bowel cleansing solutions 38
Brevibloc* 124
Brevidol* 275
Bricanyl* 322
Brinzolamide 38
British anti-lewisite see Dimercaprol
Bromhexine 39
Bromocriptine 39
Buccastem* 287
Budenofalk* 40
Budesonide 40
Bupivacaine 40
Buprenorphine 41
Buscopan 45
Buscopan Compositum 209
Buserelin 42
Buspar* 43
Buspirone 43
Buspirone Hydrochloride* 43
Busulfan 43
Butorphanol 44
Butylscopolamine 45
Cabergoline 46
CaEDTA see Edetate calcium disodium
Calcijex* 350
Calcitriol* 350
Calcium borogluconate 46
Calcium chloride 46
Calcium gluconate 46
Calcium edetate see Edetate calcium disodium
Calcium salts 46
Camcolit* 191
Camislon* 116
Canaural 145, 147, 243
Canesten* 76
Carbimazole 49
Carbomer 980 50
Carboplatin 50
Cardevidol* 53
Carbimazole 51
Carprofen 51
Carprofec 51

Errata
We apologize that these monographs were omitted from this new edition.

Ephedrine (Enurace, Ephedrine hydrochloride*) POM-V, POM
Formulations: 15 mg, 30 mg tablets; 3 mg/ml, 30 mg/ml solutions for injection; nasal drops 0.5% and 1%. A 50 mg tablet is authorized for veterinary use within Europe but is not available in the UK.
Action: Non-catecholamine sympathomimetic stimulates alpha and beta adrenergic receptors directly, and indirectly through endogenous release of norepinephrine. Also causes contraction of internal urethral sphincter muscles and relaxation of bladder muscles. Compared to more powerful sympathomimetics, e.g. oxymetazoline and xylometazoline, there is less of a rebound effect.
Use: Treatment of hypotension during anaesthesia. As well as constricting peripheral vessels, accelerates heart rate and can therefore assist in bradycardia. Also used orally in the treatment of urinary incontinence and nasal congestion (and may be of some benefit in cat ‘flu). Can be used in conjunction with phenylpropanolamine.
Safety and handling: Pregnant women should take particular care to wear gloves for administration.
Contraindications: Polyuria should be excluded before treatment is given for urinary incontinence, as many conditions that cause polyuria would be exacerbated by ephedrine. Do not use in pregnant or lactating patients or those with glaucoma. Use with caution in dogs and cats with cardiovascular disease, partial urethral obstruction, hypertension, diabetes mellitus, hyperadrenocorticism, hyperthyroidism or other metabolic disorders.
Adverse reactions: Even at recommended therapeutic doses may cause more generalized sympathetic stimulation (panting, mydriasis, CNS stimulation) and cardiovascular effects (tachycardia, atrial fibrillation and vasoconstriction). May also cause reduction of the motility and tone of the intestinal wall.
Drug interactions: Synergistic with other sympathomimetics. Volatile anaesthetics will enhance the sensitivity of the myocardium to the effects of ephedrine. Concomitant use with cardiac glycosides (digoxin) and tricyclic antidepressants (amitriptyline) can cause arrhythmias. Will enhance effects of theophylline and may cause hypertension when given with MAO inhibitors (e.g. selegeline).
DOSES
Dogs:
• Urinary incontinence: 1 mg/kg p.o. q12h. Dose should be adjusted according to effect but there is a maximum dose of 2.5 mg/kg p.o. q12h.
• Nasal congestion: No dose determined. Suggest start at 1 drop of 0.5% solution intranasally q12h. If giving orally, suggest 0.5 mg/kg p.o. q12h
• Hypotension: 0.05-0.2 mg/kg i.v.; repeat as necessary; duration of effect is short (5-15 minutes).

Cats:
• Nasal congestion: 1 drop of 0.5% solution intranasally q12h. Oral formulations not convenient for administration to most cats.
• Hypotension: 0.05-0.1 mg/kg i.v.; repeat as necessary; duration of effect is short (5-15 minutes).

Small mammals, Birds, Reptiles: No information available.

Interferon alfa (Intron A, Roferon, Viraferon) POM

Formulations: 10 million units vial of powder for reconstitution; 6-36 million units/ml solutions.

Action: Interferons are cytokines that have many effects on immunity and immune cell function.

Use: Has been used in the management of herpetic keratitis in the cat. In refractory and severe cases of feline herpesvirus infection, combined therapy including topical antiviral medication, human recombinant IFN-alpha and oral lysine, can be used. Doses, protocols and storage information are anecdotal and vary widely. Has also been used in feline retroviral infections but the authorized product (interferon omega) should be used if the parenteral route is required.

To obtain a dose of 20,000 units per eye, take a vial of 6 million units, resuspend in 1 ml sterile saline and then add to 2 ml sterile saline. This can then be aliquotted out into 0.2 ml batches and frozen. To use, take a 0.2 ml aliquot of this diluted solution and add to 0.8 ml hypromellose.

Safety and handling: Solutions in saline can be frozen for many months. Once diluted in hypromellose, the solution should be kept in a fridge and discarded after a week.

Contraindications: No information available.

Adverse reactions: Veterinary data are very limited, but ocular irritation has been seen. In humans, side-effects include: anorexia; nausea; influenza-like symptoms; lethargy; myelosuppression (particularly granulocytes); cardiovascular problems (hypotension, hypertension, arrhythmias); nephrotoxicity; hepatotoxicity and hypertriglyceridaemia (may be severe).

Drug interactions: It is not advisable to use vaccines at the same time.

DOSES

Cats: Ophthalmic: 1 drop (50 microlitres) of diluted solution per eye q6h. The recommended amount of dilution varies widely; generally
the commercial solution should be diluted at least 10-fold before use. The final dilution should be in hypromellose. If ocular irritation occurs, use a lower concentration.

**Interferon omega** (Virbagen omega) POM-V  
**Formulations:** 10 million units/vial powder with solvent for reconstitution.  
**Action:** Interferons are cytokines that have many effects on immunity and immune cell function.  
**Use:** Has been shown to reduce mortality and clinical signs of the enteric form of parvovirus infection in dogs. Has also been used to treat early-stage FeLV infection, albeit with limited success as shown by a reduction in mortality. The effect of treatment on cats with an FeLV-associated tumour is not known. No reduction in mortality is seen if the drug is used to treat FIV-infected cats. Limited reports of use in feline infectious peritonitis, acute feline calicivirus infection and feline chronic gingivostomatitis. In refractory and severe cases of feline herpesvirus infection, combined therapy including topical antiviral medication, human recombinant IFN-alpha and oral lysine, has been used.  
Has also been used topically in the management of herpetic keratitis in cats. Although used frequently with beneficial results, there are limited clinical data as to its efficacy in treating ocular disease. For ophthalmic use, reconstitute a 10 million IU vial with 1 ml of the solvent supplied and make up to 4 ml with sterile saline; decant into 0.2 ml aliquots and keep in freezer. To use, take a 0.2 ml aliquot of the diluted solution and add to 0.8 ml hypromellose.  
**Safety and handling:** In case of accidental self-injection, seek medical advice immediately and show the package insert or the label to the physician.  
**Contraindications:** No information available.  
**Adverse reactions:** Transient fatigue, hyperthermia, vomiting and mild diarrhoea may be observed. I.v. administration to cats increases the risk of these. In addition, a slight decrease in white blood cells, platelets and red blood cells, and increases in the concentration of liver enzymes may be observed. Side effects such as the induction of immune-mediated diseases have been reported with long-term administration in humans.  
**Drug interactions:** Vaccines should not be administered concurrently until the animal has clinically recovered. The use of supplementary supportive treatments such as antibiotics and NSAIDs improves prognosis, and no interactions have been observed with these.  
**DOSES**  
**Dogs:** 2.5 million IU/kg i.v. q24h for 3 days.
Cats:

- Parenteral: 1-2.5 million IU/kg i.v., s.c. q24-48h for up to 5 doses; then reduced, according to clinical effect, to twice weekly and then once weekly. Specific protocols within this dose range have been published for FeLV, FIP, FCV and chronic gingivostomatitis; users should consult the manufacturer for further advice.

- Ophthalmic: 1 drop (50 microlitres) of a diluted (500,000 IU/ml) solution per eye up to q6h for 10 days, then 1 drop q8-12h for a further 3 weeks.
